BLE MPUTER: ut of it.

Mon has only recently tested the waters of the home computer age, and he has found the waters to his liking. But with a brain capable of storing several trillion bits of information, he will be continually pushing his new found toy to greater limits. Will his machine live up to this challenge?

Sadly, many personal computers will become tomorrow's junk in the attic. The SV-318 is one that will not. Because as you get better, it gets better. It does so because of its capability and expandability—both far beyond those of any other affordable computer.

CAPABILITY. The SV-318 isn't just more capable. It's much more capable. No other computer at even twice the price combines all these extraordinary features: 32K ROM expandable to 96K; 32K RAM expandable to 144K; Extended Microsoft Basic (the industry standard); even Standard CP/M 80-column capability so you can immediately utilize over 10,000 existing software programs. The SV-318 also has a unique built-in joystick/cursor control—an immeasurably useful feature when it comes to playing your favorite video game.

EXPANDABILITY. As you become more and more skillful with computers, you'll love how the SV-318 "stretches" to meet your demands (and actually leads you in fascinating, new directions). For one thing, all eleven of our important peripherals are available immediately. With most other models, you have to wait months. For another, the SV-318 is beautifully designed to interface with new options as they become available.

AFFORDABILITY. The SV-318 is not only eminently affordable, it's the first true bargain of the computer age! Besides home budgeting, business applications, word processing, programming and self-teaching, the SV-318 is the best entertainment value in town. Not only can you use it with your TV to play hundreds of different video games, you can also use your SV-318 with a TV as a drawing tablet or music synthesizer. In play, as in work, the SV-318 will continually expand to meet your potential.

Whether you're just waiting your toes in computers, or fully afoot on the waters, the SV-318 is a computer that will serve you for many, many years. You see, we believe that even in the computer age, you don't become an object of real value unless you're around for a while.

SV-902 FLOPPY DISK DRIVE

This extremely compact, low profile unit uses standard 5 1/4" flexible diskettes. Its single side double density configuration allows a capacity of 256K bytes of data (unformatted). Linked to the Super Expander, the SV-902 is your key to the virtually unlimited scope of CP/M Q/S as well as a complete variety of program languages such as LOGO, PASCAL, FORTRAN, COBOL and PL-1.

SV-601 SUPER EXPANDER

The real value in any computer system lies in its ability to accommodate a large variety of input/output devices simultaneously. With the addition of the SV-601, the SV-318 can interface with as many as seven different devices at one time. Although lightweight, the SV-601 can support a 15" TV monitor. Special front view slots have been designed to monitor the operation of the different interface cards that are connected to the system.

SV-903 DATA CASSETTE

This feature-packed data cassette draws power from the SV-318, to which it is connected. By using a stereo head, you can store data on one channel, and voice or another. This greatly enhances the use of stored data. Programs such as tutorials, manuals, and voice-assisted training can be stored. The data cassette will be an integral part of your system even if you choose to expand into a disk drive. The cassette even has a built-in condenser microphone so you can write your own voice support programs.

ARE YOU STILL LETTING YOUR PRINTER TIE UP YOUR COMPUTER?

While your printer is running, your computer is tied up. You can't use it for processing, computing, data entry. Nothing. All you can do is twiddle your thumbs until the program is finished.

Pretty ridiculous.

MICROBUFFER ALLOWS YOU TO PRINT AND PROCESS SIMULTANEOUSLY.

You just dump your printing data directly to Microbuffer, whoosh!, and continue processing. No waiting.

Microbuffer accepts data as fast as your computer can send it. It stores the data in its own memory buffer then takes control of your printer. It's that easy.

THERE IS A MICROBUFFER ESPECIALLY FOR YOUR APPLE.

Microbuffer II (just one in the full line of Microbuffers) is designed to be specifically compatible with an Apple II

computer. An intelligent interface card with up to 32K of RAM for data buffering, Microbuffer II features on-board firmware for text formatting and advanced graphics dump routines. Both serial and parallel models have energy-efficient low power consumption coupled with a high data transfer rate. Print formatting functions include Basic listing formatter, self-test, buffer zap, text screen dump, fully programmable control characters and transparent and maintain modes —

to name only a few.

Microbuffer II is simple to install — being slot-independent, it slips directly inside the Apple II in any slot except zero. The 16K model is priced at \$259 and the 32K, at \$299.

Other Microbuffer models include Microbuffer/E for Epson printers and a stand-alone, in-line Microbuffer unit to unite virtually any computer/printer combination.

MICROBUFFER FROM PRACTICAL PERIPHERALS.

So what are you waiting for? Write to us for more information or ask your dealer for a demonstration.

When you see how much freedom Microbuffer will allow, you'll understand why it's so silly to be without one.

A Small Disagreement

Dear Editor:

I disagree with a statement which appeared in the August, 1982 issue in the column "Outpost: Atari."

David and Sandy Small were discussing the speed of the Atari disk drive. They stated that the serial bus cable and the write-with-verify slowed down the disk drive access. They recommended turning off the read-after-write feature of DOS.

The Smalls state that they have never had an error message that means the read-after-write failed.

They stated that many of their associates have had errors, but only on defective disk drives. I find this hard to believe. It may be that errors have occurred to the Smalls, but DOS was able to recover, which means that an error message would never be displayed. The Smalls also stated that the time spent waiting for the Atari to verify data just isn't worth it. *This is not true.*

As with many features of the Atari hardware and software, the DOS was designed to be easy to use and as transparent as possible. By providing automatic error detection and correction logic to DOS, this has been accomplished. DOS will retry I/O operations 10 times. If the problem still is not corrected on the tenth try, then an error message is displayed.

Atari includes a section in their manual which tells you how to turn off the read-after-write feature, but the Smalls are wrong in recommending this practice to unsuspecting users.

If the Smalls never have problems with their disk files, then they are either very lucky or don't do a large amount of writing to disk.

Munching Out

Dear Editor:

While Robert Cashman has described Munch Man in fine style, I would like to offer him and other users of this TI game directions to access the Test Mode/which should provide (provoke) even greater enjoyment.

To access the Test Mode, you have 3-seconds from the time the Munch Man screen appears to type "#*." (Hint: When the screen says, "Press any key to begin," hold the Shift key down and type 8, 3, 8/(*#*#).

You know when you're in the Test Mode when the screen changes and the first prompt asks which round you'd like to play in. When "RND(0-2)" appears on the screen, type either 0, 1, or 2.

The second prompt asks you which screen you'd like to play. When "SCN(0-19)" appears, type your choice (from 0 through 19).

The third (and, last) prompt asks you for the number of Munch Men you'd like to play with.

When "MM(1-9)" appears, type your choice (from 1 through 9). Note: the computer expects you to type "9" and has strategy to deal with this choice as you'll quickly learn.

These three-prompts appear on the same screen in the order described. Be quick about typing your choices for the three-prompts or the timing will advance the game automatically for you.

And, for those who have difficulty counting (as initially I did) remember that for the first- and second-prompts, 0=1!

As long as you "win" at any level the game continues to the next higher level screen (a total of 60). Whenever you do NOT win, Munch Man automatically reverts to the first-screen—or, if you want to access any higher levels, you repeat the procedure to access the Test Mode.

When you "play" the 20th-screen (type 19, please), be prepared. Irrespective of the Round (RND 0, 1, or 2) chosen, you'll be at the supercalifragilisticexpialidocious level!

A Pound of Cure

Dear Editor:

A few months ago I wrote to you, to tell your readers that I was interested in compiling a book of listed programs for use in Microcomputer Applications in Medicine. You kindly published the letter. I had no idea of the response that might deluge me. I received letters from all parts of America, Canada, South America, Europe, Israel, South Africa and even a letter from China. There were early morning phone calls, picture postcards, packets of discs, bundles of listings, it was a tremendous response.

Several publishers wrote or telephoned me stating their interest in publishing the book.

The outcome is that the book is now published by Medical Software Co., Box 874, Center Moriches, New York 11934, price \$80.00.

The volume contains medical application programs for patient scheduling, record retrieval, simple billing, utilization of equipment, simple statistics; standard deviation calculations and curve fitting routines.

Programs are still coming in and are being reviewed for the second volume which should be ready in April 1983. I want to thank everyone again for the tremendous response.

Source Code for Authoring Languages

I would like to thank the many people who have written me concerning my Pilot-to-Basic translator. As I discussed in my article the translator was created to provide teachers at a teachers' convention with a hands-on introduction to Pilot and not as a full version of Pilot.

Many of the writers have asked for information concerning source code to allow Pilot to run on other machines. The following is a list of the information on some suppliers. Since I have had no opportunity to review their products, I am unable to make any comment on the various implementation.

Free or Nearly Free

These versions of Pilot are translator programs that take Pilot and turn it into either Pascal or Basic. They do not support storage of student information.

1. Pascal version of Pilot. Program given in July 1980 *Byte* article called "Pilot/P: Implementing a Language in a Hurry" by D. Mundie.

2. Apple version of Pilot. Program published in *Creative Computing*, October 1982 and on in article called "Pilot-to-Basic Translator" by M. Smith.

THE LEADING EDGE IN PRINTERS

ONE GREAT LINE. ONE GREAT WARRANTY.

Finally, there's one full family of printers that covers every business or word processing application—all from C. Itoh, a company known for packing more product into less price, and all distributed exclusively by Leading Edge, a company known for searching out and providing that very thing. Which means that one call to one source can get you any printer any time you need it, for any purpose. All backed by a full years' warranty from Leading Edge. (Try that on any other line of printers.)

THE PRO'S.

The Prowriters: business printers—and more. The "more" is a dot-matrix process with more dots. It gives you denser, correspondence quality copy (as opposed to business quality copy, which looks like a bad job of spray-painting).

Prowriter: 120 cps, 80 columns dot matrix compressable to 136, 10" carriage. Parallel or serial interface.

Prowriter 2: Same as Prowriter, except 15" carriage allows full 136 columns in normal print mode. Parallel or serial interface.

THE STAR.

The Starwriter F-10. In short for more precisely, in a sleek 6" high, 30-pound unit, it gives you more of just about everything—except bulk and noise—than any other printer in its price range. It's a 40 cps letter-quality daisy wheel with a bunch of built-in functions to simplify and speed up word processing. It plugs into almost any micro on the market, serial or parallel.

THE MASTER.

The Printmaster F-10. Does all the same good stuff as the Starwriter except, at 55 cps, the Master does it faster.

The lead article in the January 1976 issue was titled "Building A MITS Altair 8800." We noted that we got into trouble because the solder pads were too close together on the PC board and because of the 66 wires which must be soldered one-by-one to the display/control board. We criticized MITS for providing only two programs, one to add and the other to multiply binary numbers.

Despite our criticism of the Altair we concluded that "unless some other company can fight this already well-established computer kit with a bigger and better advertising campaign (and not necessarily with a better computer kit), then the 8800, the 680 and future Altair computers will give MITS the micro-equivalent of IBM's continuing and overwhelming success."

We had an article, "Beating the Game" which discussed Edward Thorp's card counting system for playing blackjack. This was years before Ken Uston used a similar method to win millions in Las Vegas and Atlantic City.

An article on magic squares showed how to construct $n \times n$ squares with many different properties.

A section on computer chess discussed different techniques and a tough match played between International Master David Levy and a program called Ostreich which runs on a CDC Cyber 175. Levy finally won.

A huge 15-page section of the issue had 107 puzzles and problems, many of which were suitable for computer solution. And the issue had seven challenging games including Wumpus-2, Chase and Road-race.

The back cover ad was for the MITS Altair 680 (\$345 for the kit with 1K of memory). At the other end of the spectrum was an ad from Educomp for a DEC PDP-8 multi-user system for \$31,240.

Our new products section had announcements of three new magazines, *Computer Notes*, *The Computer Hobbyist*, and *Byte*. Although some people consider *Byte* the granddaddy of personal computing magazines, *Creative* predates *Byte* by nearly a year. □

Buying a Printer

Background

Back in 1976, we did our first printer review for the January 1977 issue. It was of the Teletype Model 43 terminal. In those days, selecting a printer wasn't too difficult. You either bought a used Teletype ASR-33 (upper case only, clunk, clunk, clunk), a new Teletype 43 (dot matrix, buzz, buzz, buzz) or you jury-rigged something between your computer and a used printer from a mini or mainframe.

By the time we did our first printer roundup (December 1979), it was getting more difficult to choose a printer. Both dot matrix and fully-formed character units were available in a price range attractive to the personal computer user. Nevertheless, prices were high by today's standards. The least expensive printer on the market was the Integral Data IP125 at \$799, and from there the prices rose quickly to \$2995 for a Qume Sprint 5.

Subscribers to *Creative* will remember that our review was quite critical. Qume wouldn't talk to us for ages after the review appeared and Malibu wasn't too happy either. Qume has its act together today and the Sprint 5 that we berated in 1979 is still in daily service. One could conclude that it has passed the test of time.

Those of you who have followed our printer reviews over the years have undoubtedly noticed two things. First, the reviews have never pulled any punches. We feel our first responsibility is to the reader and, in the long run, honest, in-depth reviews are in the best interest of everybody—even though some manufacturers might be temporarily upset. Second, choosing a printer is an increasingly complicated task.

Part of the reason the choice of a printer is so complex is that the choice is so wide. Today over 90 printers are available in the under \$5000 range, and 75 can be had for \$3000 or less. Indeed, narrowing the field to units under \$1000 still gives one a choice of 25 or so printers (compared to just two in 1979).

David H. Ahl

But price is not the only variable. One must consider print quality, print type, paper type, speed, noise, controls, graphics capability, interfacing, servicing and longevity.

Unfortunately, this last characteristic, longevity, is extremely important, but nearly impossible to measure when a printer is new or nearly new. Moreover, a sample of one or two is not sufficiently large to derive frequency of repair or length of service figures. Therefore, one must make some informed judgments in the area of longevity based on manufacturer history and reputation, design of the unit, number of moving parts, and the like.

The large number of printers available and the many more being introduced every month make it nearly impossible to review all of them or even a majority in one issue, or even 12 issues. Hence, we chose to review a cross-section of printers, several with new design features, in this issue. As we have in the past, we will continue to review printers throughout the year, sometimes singly and sometimes in a group.

To select a printer, you should familiarize yourself with printer types,

capabilities, and features. Then when you see a printer in a store or advertisement you will be able to make an intelligent evaluation of it, both compared with others in the field, and, more important in terms of meeting your needs and budget.

Here we present a discussion of various features that will help you to evaluate printers.

Type of Print

Basically, type of print falls in one of two groups: dot matrix or fully formed characters.

A dot matrix printer uses a vertical row of wires which strike the ribbon as the printhead travels across the page. The printhead usually has either seven or nine wires. A character is formed from a matrix of dots, usually 5 x 7 (5 dots wide and seven high) or 7 x 9. Increasingly, manufacturers are using other arrangements to produce a more attractive character set. One novel approach uses seven wires which are slightly staggered.

Although dot matrix printers today are a considerable improvement over those of just two or three years ago, they still fall a bit short of what most people consider "letter quality." Even the best dot matrix printers cannot produce a character as precise in detail as a good

Modern dot matrix printers are compact and reasonably quiet.

typewriter can produce. On the other hand, many dot matrix printers produce print good enough for routine correspondence, memos, internal products, program listings, financial printouts and the like.

A printer with fully formed characters is sometimes called "letter quality," meaning that it is suitable for most formal business correspondence. Essentially, it is equivalent to an electric typewriter.

However, just because a printer uses fully formed characters does not auto-

matically mean that it is better (or even that it produces a better-looking document) than a good dot matrix printer. Just as electric typewriters run the gamut from cheap home portables to top quality office units, so do printers, but even more so.

This wide range of quality is due mainly to the print mechanism. These

are of four types. First is the mechanism found on manual and older electric typewriters in which each letter is on the end of a typebar. This is a cumbersome mechanism and, because of carriage movement at the end of each line, is not suitable for continuous forms. Few, if any new printers are being produced using this mechanism—and with good reason!

Second is the typeball mechanism pioneered by IBM on the Selectric typewriter. Some typeball printers are simply office electric typewriters with solenoids installed to pull down the keys. These are not designed for continuous duty even though outwardly they look virtu-

Side view of dot matrix print head shows pins.

ally identical to IBM units built for use as terminals. Although a few new typeball printers are being built today, most are either modified IBM office electrics or reconditioned (i.e., used) IBM terminal units.

A third, and perhaps the most popular, mechanism is the daisy wheel—so called because it looks like a black plastic (or metal) daisy. (Actually, it looks more like a chrysanthemum, though I can well understand why it was not called a chrysanthemum wheel.) This little 4" diameter wheel with molded characters on the end of each spike constantly spins, and a solenoid strikes the correct character when it is at the 12 o'clock position. The wheels come in plastic and metal. The metal ones have a longer life (and cost more).

A variation on the daisy wheel is the

thimble design. A type thimble looks like a daisy wheel that has had its petals bent down over a small Dixie cup. (I'd hate to meet the person with a finger big enough to use one of these babies as a thimble.) The striker mechanism is similar to that in a daisy wheel printer.

Print Quality and Style

As suggested above, the print quality of a dot matrix printer is not as good as that of a fully formed character printer, but it is quite adequate for many purposes. Since not all manufacturers use the same dots within the matrix to form the same character, personal preferences come into play. Look especially at the following letters on different dot matrix printers to see which you prefer:

W,a,f,g,j,k,p,q,r,w,f,4,5,*,@,5,&

Perhaps the most important element of print quality, if you are considering using your printer for outside correspondence, is lower case descenders. Many people find the absence of descenders objectionable, and a document produced without them is noticeably more difficult to read than one with descenders. However, if price is your most important consideration and you use mostly words without g, j, p, q, and y...

In addition to printing the original, printers are often called upon to make carbon copies. Like typewriters, some do this considerably better than others. In general, on fully formed character printers, a metal daisy wheel, thimble, or typeball will produce better carbons than a plastic one. Dot matrix printers do not count among their strong points the ability to produce good quality or large numbers of carbon copies.

You may also wish to look at print samples on different types of paper. For example, rag bond watermarked paper has more texture than "normal" computer paper; this affects the amount of ink transferred to the paper, sometimes causing the type to look uneven. If much of your work will be on paper of this type, be sure to try it out.

On individual characters, you might

ALIEN ambush

by Peter Fokos

You haven't lived until you've died in space.

And here's your chance.

Software author Peter Fokos has created Alien Ambush, a space age nightmare. It's a hi-res, full-color arcade game, fiendishly written to give those nasty aliens every advantage.

So if you have access to a 48K Apple* with DOS 3.3 or a 16K Atari 400/800** with a disk drive, and you're hot for some new thrills, Alien Ambush was written for you. But be warned: it just got a lot tougher to survive in space.

Glossary

Bi-directional: the ability to print with the printhead moving right to left, as well as left to right. Eliminates need to reposition printhead to left margin for every line.

Buffer: the area in which excess data are stored until the printer is ready to print them. This area is described by amount of memory (less than 1K is very small, with 2K about average).

Characters per second, or cps: the number of characters that a printer is capable of printing in one second.

Character set: the style of type output by the printer, also known as the type font.

Descender: the portion of a letter that trails below a line. The lower case letters g, j, p, q, and y and sometimes the upper case Q have descenders. The fonts on inexpensive printers often lack true descenders.

Dot matrix: a method of printing wherein each character is composed of an array of dots, as opposed to fully formed characters.

Electrostatic print: when characters are etched onto paper using a small electrical charge.

Friction feed: when the paper is advanced and held in place by friction between two rollers. This allows for the use of single cut sheets of paper.

Fully formed characters: when the character is formed all at once, upon impact of a striker, through a ribbon, onto the paper. This category includes daisy wheel, typeball, and thimble printers.

Graphics: the ability to print specific graphics characters in addition to text. An increasingly necessary printer feature.

Hard copy: a printout.

Horizontal tabulation: the ability to let

the user specify, through hardware or software, the number of columns per line.

Impact print: when print is obtained by the impact of a striker through a ribbon. This category includes fully formed character printers as well as many dot matrix printers.

Ink jet: a new technology wherein a printhead blows small streams of ink onto the paper to form the characters.

Laser printing: a state-of-the-art technology which uses a laser to burn print onto the page.

Letter quality: an abused term which once simply meant print quality indistinguishable from correspondence prepared by traditional (typewritten) methods. Once no dot matrix printing was considered to be letter quality; new technology and recent advertising have worked to change this. Undoubtedly the quality of letter quality is in the eye of the beholder.

Line spacing: the number of lines per inch.

Logic-seeking: the ability of a printhead to discern the quickest route to its next printing position.

Multipass: the ability for a printhead to be controlled, through hardware or software, to remain on the same horizontal line, and print on top of existing copy.

Noise: quite simply, the sound a printer makes. This varies greatly from printer to printer, and may be significant not only when a printer is printing, but when it is waiting to print.

Out-of-paper warning: a small but convenient feature of some printers to signal that the paper supply is out.

Parallel interface: a method of sending printing codes from a computer to a printer or other device, wherein typically one entire byte of information is sent simultaneously. A majority of microcomputer printers use this approach.

Pinfeed: a method of paper transport in which paper is pulled through the print-

er by a sprocket with pins, fitting perforations punched in the paper. Same as sprocket feed.

Plain paper: usually refers to regular cut sheet bond, as opposed to roll, fanfold, or treated electrostatic and thermal papers.

Print density: the size of the matrix used for each character. The more dots per character, the better the character will look.

Printhead: the device which houses the printing mechanism. As opposed to portable and older office typewriters, the paper moves only vertically, while the printhead usually moves from side to side.

Print quality: refers to how the characters actually look on paper.

Proportional spacing: refers to the spacing of individual characters. The font you are reading now is proportional: an *i* is narrower than an *m*. Printers with proportional spacing capability can create more professional output. Most daisy wheel printers, like most typewriters, do not offer this feature.

Self-test: many printers have this built-in test feature which simply spurs out the entire character set.

Serial interface: a method of sending printing codes from a computer to a printer or other device, wherein one bit of information is transferred at a time. This is usually slower than parallel interfacing, and commonly makes use of an RS-232 port.

Thermal print: requires special heat-sensitive paper that darkens when a hot printhead "burns-in" the dot matrix. Similar to, though quieter than, electrostatic printing.

Tractor feed: very much like pin or sprocket feed, with pins revolving on a tractor tread.

True descenders: see descenders.

Vertical tabulation: allows the user to specify the number of lines to be printed on a page of paper. —OWL

want to examine ink density, edge definition, and "fuzziness" with a low-power magnifying glass. Also, look at density at both the top and bottom of the page. Print the same line or short paragraph for a page or two; the last lines should look the same as the first.

On fully formed character printers, look at a dense letter such as a capital M next to a small character such as a period or comma. A good quality printer will automatically adjust the striking force so the ink density is the same on both characters. Beware if the M looks light compared to other letters and the periods and commas make the back of the sheet feel like Braille.

A popular misconception is that all characters should be in a perfect line. This is not true. In most character sets, round letters such as c, e, and o are slightly larger than "square" letters such as r, n, and u. The lower case t is not as high as h or l. A good fully formed character printer preserves these nuances, which contribute to a pleasing visual impression. Since the dots in a dot matrix printer are always in exact alignment, the print lines will be evenly-printed, uniform, and somewhat boring.

Print Speed

If you are buying a printer for a company or if you are a very prolific author

with a print requirement of a million sheets per month, a very high speed printer (900 lines per minute or more) will be needed. In general we are not considering these units here, and for buying advice we recommend you turn to *Datamation* or another DP managers' magazine.

A high speed printer with a print speed in the 300 line per minute neighborhood is suitable for volumes of 50,000 sheets per month.

For people who require fewer than 50,000 sheets per month, slower printers are quite satisfactory.

Some manufacturers publish print speeds in lines per minute and others in

Buying a Printer, continued...

characters per second. There is good reason for this since some printers print an entire line at a time, and, whether the line consists of one character or 120, it takes the same amount of time to print it.

On the other hand printers which print a character at a time can rush over a single character line and get on to the next one lickity quick. So, it is difficult to compare the true speed of a line printer with a character printer. In general normal business correspondence and reports have 60 characters per line. A little arithmetic leads to the "rule" that, for a 60-character line, lines per minute equals characters per second.

But what does this mean? Well, a typist working at 60 words per minute is typing about 6 cps. A double-spaced page contains about 250 words. Thus a 60 wpm typist could type such a page in a bit over four minutes. A 100 cps or 100 lpm printer ought to be able to produce the same page about 17 times as fast as our typist, or in about 15 seconds.

Oh, that it were so simple. But at least it is a good starting point. Complicating things is the fact that the published manufacturer speed rating is usually considerably faster than what a printer produces in actual service. This is due to linefeeds, carriage returns, computer "handshaking," and perhaps even some just plain exaggerated claims. Nevertheless, since all manufacturer figures tend to be high by roughly a factor of two compared to actual service speed, they provide at least a comparative measure of speed.

As with cars, package delivery services and running shoes, higher speeds cost more money. However, it is probably worthwhile to look for a printer that is somewhat faster than you need today. There are two reasons for this. First, inevitably, your print requirements will increase. Yes, you read about an all-electronic, paperless society, but somehow it always seems to be in the future.

The second reason to look for a faster printer than you "need" is that most printers are not built for continuous duty. A 100% duty-cycle means operating hour after hour producing pages filled solidly with letters and numbers. Printers that are run beyond their duty-cycle capabilities will suffer greatly increased malfunctions and breakdowns. While many (all?) manufacturers claim "long life" for their machines, duty-cycle ratings are often not clearly stated. Ask about them.

Bi-directional Printing and Print Buffers

Some printers are designed to print from right to left as well as from left to

A good quality dot matrix printer can produce excellent graphic images.

right. This saves time in that the printhead does not have to return to the left side of the page at the end of each line. While it sounds like a neat capability, the real time saving is fairly small. A typical printhead return is accomplished in about the time it takes to print three characters, so if you are printing lines of 75 characters, the time saving is about four percent.

In order to print in both directions, a printer must have a buffer to store temporarily the line that is to be printed "backwards." In some printers, this is useful beyond permitting bi-directional print capability, as the buffer is able to accept data from the computer at a high speed and with less "handshaking" than is required without such a buffer. In general, this leads to more accurate transmittal of data. It also lets the printer proceed steadily at its own speed, when the information coming from the computer arrives faster or slower than the pace of printing.

The size of the buffer indicates whether it will store just one line for bi-directional printing (buffer size = length size, say 100 or 150 characters) or if it will store a page or so. A 2000 character storage capability (about 1-1/3 double-spaced pages) is common.

Characters, Lines, and Spacing

Different printer uses require different character sets (letters, numerals, symbols). Most printers provide character sets (or fonts) that include both upper and lowercase letters, the number 0 to 9, and a set of symbols. Frequently the print symbols will not match those on your computer keyboard. For example, an up arrow on the keyboard may print as a left bracket, and so on.

Be sure that the character set on the printers you are considering will meet your needs. While print wheels can be changed to provide a different character set, you do not want to have to do this in the middle of a document.

Dot matrix printers, because of the way they produce characters, can theoretically produce any character at all. However, certain characters are "built-in;" these comprise the character set.

Pitch is the number of characters printed per horizontal inch (cpi) in the "normal" or default mode. In general this will be 10 or 12. A higher cpi, say 13.2 as found on the Teletype 43, results in more words fitting on a page but may also result in lower readability.

It is more difficult to use letterhead or envelopes in a tractor or sprocket feed printer. One approach is to attach individual sheets of stationery to sprocket feed computer paper and then load it

A single sheet feeder can be attached to some tractor and pin feed printers.

into the printer. Peel-off envelopes, which can be attached to continuous feed paper, are also available. This approach is anything but convenient and has driven more than one user to buy two printers.

A small handful of printers allow printing subscripts and superscripts. To do so involves vertical movement of less than a full line and then a return to the main print line. This requires control characters from the computer on both sides of the sub- or superscript. This capability is rarely worth the effort and expense.

Noise Control

Printers are rather noisy creatures since in most a piece of type or a group of pins are striking a piece of paper with a roller behind it. Those with typeballs or metal daisy wheels are especially noisy.

There is no common industry measurement of printer noise (like decibels three feet in front of the printer), so most manufacturers simply claim their

printers are "quiet." Some manufacturers have gone to great effort to keep their printers as quiet as possible by lining the case with layers of acoustic foam while others have achieved quietness by virtue of clever printhead design. Still others have ignored the problem entirely.

We recommend listening to various printers in a store before buying one. But bear in mind that it will always sound noisier in your office or home (one of Murphy's unstated laws).

Interface

Most printers have either a parallel or serial interface, and many have both. This does not mean that you can necessarily plug a Brand X printer into a Brand A computer just because they both have a parallel interface. Would that it were so simple!

Two parallel interface standards are in common use, one established by Centronics and the other by Dataproducts. But many computer and printer manufacturers think they have a better way and do not adhere to either of these standards.

Serial interfaces also come in two basic flavors, the old 20 ma current loop interface started by Teletype Corp. and the RS-232C interface.

The IEEE also has an interface standard which is beginning to be offered by some manufacturers; other groups also have proposed standards. However, at the moment there is virtually no industry-wide agreement.

Further complicating the situation is the interface cable. On various computers you will find a huge variety of connectors—dual 17-pin flat, 5-pin DIN, 40-pin connector, A-800, C-130, and on and on. There is less variety on

printers, but the point is that you will need a cable to go between your printer and your computer, and it doesn't generally come with either unit. Unless you are quite comfortable reading schematic diagrams and soldering tiny pins, we do not recommend making your own cable, even though you may save more than half of the typical \$25 to \$50 cost of a cable.

Service and Maintenance

There are no perfect printers. All of them require service and maintenance sooner or later. However, a well-designed printer is easy to maintain and should require only infrequent service. Nevertheless, it is important to realize that occasionally it will be out of service. Unlike an office typewriter for which there can usually be found a spare around, it is unlikely you will have a spare printer in reserve.

When the ribbon or paper runs out, or when the paper feeds incorrectly or jams, a well-designed printer will stop by itself and alert the operator with some sort of audible alarm, visual indicator, or both. Lightweight paper is more likely to jam due to enlargement and tearing of the sprocket holes. If you intend to use a lightweight 15# paper, be sure to try it in the printers you are considering.

A printer should be cleaned and vacuumed out periodically depending upon its frequency of use. Paper dust is an enemy of the precision gears in the printhead and paper movement mechanisms and can even hamper the operation of the solenoids in the printhead. A \$24.95 hand vacuum is well worth the investment if it saves just one service call.

When you purchase your printer, it is probably worth getting two or three extra ribbons at the same time. Although ribbons dry out if they are left too long on the shelf, they come in sealed plastic packages which should keep them fresh for at least six months. Nothing is more maddening than trying to print a finished business document to send to somebody important and suddenly realizing that your ribbon can produce only a light shade of gray. (We receive scores of articles from prospective authors printed in light gray. Frankly, they don't get as careful a reading as those printed with a good, black ribbon. Perhaps we unconsciously feel that the care taken in appearance reflects the care taken in writing.)

As might be expected, all manufacturers claim that their printers are highly reliable. Unfortunately, there is no industry standard for measuring mean time between failure, percentage of up time per thousand hours, etc. Thus, manufacturer reputation comes into

Some printer ribbons are in easy-to-change cartridges. Others use typewriter-like spools that are more difficult to change.

Buying a Printer, continued...

play, but even that is a less than perfect guide since new manufacturers have no reputation, good or bad, to go by and established manufacturers may introduce a new design significantly better or worse than past ones.

We recommend gathering as much information as possible about reliability and service from stores, friends, clubs, magazine reviews, and manufacturer literature before plunking down your money for a printer. On a new printer today, it is reasonable to expect that outside service should be necessary no more than twice a year—assuming, of course, that the printer is suitable for your volume of work.

However, you will inevitably need some outside service sooner or later. Find out in advance where the printer must go, or whether someone is available to come to your premises. Some manufacturers provide service at regional depots, others depend upon the local dealer, while still others recommend a "third party" maintenance organization such as Sorbus or RCA.

Color Printers

During the past two years, six dot-matrix printers have been introduced capable of printing multiple colors. These use a variety of different printing techniques. One has a ribbon with the first quarter impregnated with red ink, the second quarter with yellow, the third with blue and the last with black. A page is printed with the first color, then the feed is reversed and the sheet brought back to the top and printed with the second color and so on. Another approach uses a wide ribbon with four colors on it in horizontal stripes; a ribbon positioning mechanism is used to place different

colors under the printhead.

Color ribbons are generally available in both black plus the three primary colors (red, yellow, blue) and black plus the three primary printing colors (magenta, yellow, cyan). The first is best for pure, solid colors (graphs and charts), while the second is better for color mixing to produce full-color effects (photographs).

No color printer will produce an image as good as a photograph or printed picture. However, they are excellent for producing business charts and rudimentary graphics.

Non-Impact Printers

All the printers discussed thus far have been impact printers of one sort or other. There are, however, many printers that produce output without using any kind of mechanical impact, relying instead on a variety of clever, non-impact techniques.

Few of these printers have received wide acceptance, but each has its followers and devotees.

Thermal and electro-sensitive printers share many characteristics. Both types use sensitized paper usually on a roll rather than single sheets or fanfold. Both can produce only one copy at a time. They are very quiet and relatively inexpensive.

Thermal printers use heat sensitive paper which is activated by heat wires or pins that press against the paper to form characters. These printers are generally relatively slow (30 to 120 cps). But for a basic utility printer in applications where roll paper and modest print quality are acceptable, a thermal printer may fill the bill.

In a similar manner, electro-sensitive printers use a paper with a special metal-

lic coating. These are faster than thermal printers (speeds up to 225 cps), and produce a slightly better quality copy although other metallic objects (coins, letter opener, pencil, clip, etc.) will leave marks on the sensitized paper.

The price of ink jet printers has been plummeting recently, putting some of them within reach of personal computer users. These machines literally squirt characters onto paper from specially designed ink nozzles. The speed and price range is extremely wide—speeds from 30 cps to 3000 lpm (yes, lines per minute!) and prices from around \$2000 to over \$30,000. Characters are generally produced in the form of a dot matrix, although ink jet printers tend to use more "dots" and thus produce a slightly better result than a standard dot-matrix printer.

There is at least one ink jet color printer on the market. It produces a somewhat more satisfactory image than the output from dot matrix impact printers.

There are three other technologies used in high end printers: lasers, electrostatic toner (like a Xerox copier), and magnetic image transfer. Printers using these technologies generally sell for \$10,000 and up (far up—one laser printer goes for \$300,000) and are aimed at specialized, high-volume operations.

In Summary

When selecting a printer, the first thing to do is analyze your needs. What quality do you need—draft, correspondence, or letter? What volume do you expect to print, i.e., how fast a printer do you need? Do you need extra character sets such as Greek letters, mathematical symbols, italics, or extended letters? Do you expect to output graphics? What kind, graphs or "pictures"? Will your printer have to handle single sheets, continuous feed paper, forms, envelopes, labels or wide paper? Will it be located in a relatively quiet place where you and others are working? What kind of computer and software do you expect to use with it? How much time can you afford?

When you have answered the above questions, you should start gathering as much information as you can from as many sources as possible—friends, clubs, magazine reviews, advertisements, trade shows, stores. Try to narrow your choice to two or three acceptable printers. Then determine for each an acceptable maintenance arrangement; this is generally more important than the purchase price.

Remember, in purchasing a printer, the true cost includes not only the purchase price, but supplies, technical support, routine maintenance, repairs, and down time.

Ink jet print element has seven tubes leading from the ink reservoir to the jets.

Print About Printers

So you want to buy a printer, eh? Well you are not alone in that. Nor are you alone in your probable confusion concerning which printer to buy. Printers are the fastest-growing peripheral market in the microcomputer industry today. It seems as if a new crop of them appears every six months or so. Print quality and extra features continue to improve, while prices continue to fall. That is, on the whole, quite good news, but it makes the job of deciding on a printer really tough. "If I just hold out," you may be saying to yourself, "I'll be able to get more for less." And though salespeople may deny it, you'll be right. But you'll be hurting if you hold out too long, for every day you hold out is another day without a printer. Read on, and decide how long you can wait.

Just two years ago, a serviceable dot matrix printer cost about \$1000 and needed service on an average of twice a year. Then the \$500 Epson MX-80 made its debut and changed everybody's expectations. It was quiet, affordable, reliable, easy to use, and produced nice copy. It remains one of the most popular microcomputer printers.

As Dave stated in the preceding article, the most important consideration a buyer can make about a printer is one any reviewer has a justifiably hard time evaluating: reliability. Until at least a few months have passed, it is nearly impossible to make a fair judgment regarding the reliability of a printer. As opposed to a computer, which seldom has any moving parts aside from its keyboard, a printer is a mechanical contrivance, and therefore heir to all the potential problems mechanical devices can suffer. It is fair to expect that a printer will receive at least annual service, even if it is running just fine. In that way the owner may ensure that it will

John J. Anderson

continue to do so.

There are certain judgments that can be made upon first inspection of a printer—and, in selecting the right machine, you must choose the right criteria on which to base your decision. Here we look at 13 machines, judge them in terms of several criteria, and draw overall conclusions concerning what a consumer can expect from a printer within a selected price range.

To get a firm idea of what one should judge in a printer, let's first examine the criteria themselves.

Type: By this we mean the method of printing the machine uses. Categories here are daisy wheel, dot matrix, and ink jet. Your decision here will depend on what quality of print you need, and at what speed you want to produce it. We will pass no judgment on this criteria, though we will consider no thermal or electrostatic printers. The price of impact dot matrix printers has dropped to a point where thermal and electrostatic printers, which require specially treated papers and are typically lacking in print quality, now have a markedly decreased appeal.

Feed: This indicates the means by which the paper is propelled through the printer. If you are interested in using bond or letterhead paper, you will require a friction-feed machine, which handles paper the way a typewriter does. Tractor-pin, and sprocket-feed machines will, in contrast, allow the use of continuous form paper, in roll or fan-fold format. Obviously a continuous format will be more convenient for high volume printing, unless you are prepared to pay for a

machine that offers automatic single sheet feed. This option is generally only available on machines costing over \$2000.

Speed: An underscored caveat should be posted here. Just as the EPA ratings for automobile mileage in no way reflect actual road conditions, the speeds claimed for printheads in no way reflect actual print conditions. For comparison, however, the numbers can be helpful in determining the actual "throughput," or true speed at which work is turned out by the machine. Fully formed character printers such as daisy wheel printers are the slowest, typically having speeds of less than 30 characters per second (cps). Dot matrix printers can produce rates up to 200 cps, with print quality decreasing inversely. The ink jet printer we tested has been rated at 270 cps, which is quite fast.

Interface: This criterion takes into consideration how easy (or difficult) it is to hook the machine up for use. Since nothing remotely resembling an industry standard has yet been adopted, getting a printer up and running can sometimes be a dramatic challenge. The closest thing to a standard currently available is the famed "Centronics-compatible" connector for parallel connection (curiously, no longer used by Centronics printers), and the time-honored DB-25 connector for serial connection. These are the connectors I am happiest to see when I look at the hind side of a printer. I am quite frequently disappointed, however. One can only pray that some time soon a standard will be agreed upon.

Density: This refers to dot matrix and ink jet printers only, and specifies the maximum number of dots that can be printed horizontally and vertically. The more dots that are available in a dot matrix, the better the quality of the print. Specifications are sometimes given by the

FIRST THINGS FIRST. LEARN ALL ABOUT IT!

When you don't know the first thing about your new Apple II* you need a friendly, cheerful, easy going teacher at your side. And the ELEMENTARY APPLE is just that kind of book.

It sweeps away the confusion—explains your Apple in everyday language—shows you how to hook it up, how to use the keyboard and work on the screen.

Gently and carefully it gives you an understanding of all the things your Apple can do. And then, it even shows how easy it is for anyone to write a simple program—provides common sense answers about graphics, utility programs, and the how and why of word processors, business programs and hardware like printers.

Yes, there's a lot of information. But, not one chapter or one word is dull or difficult to follow or complicated. Prove it to yourself. Visit your computer store. Open the ELEMENTARY APPLE. Read a page of the introduction, then flip it open anywhere and read a paragraph or so. You'll find it's as understandable, as helpful and as marvelous as we say.

If you, or a member of your family, is an Apple beginner, this is the book you need. It'll teach you everything you want to know, in the way you want to learn.

character, sometimes by the inch. A minimum matrix is composed of 5 x 7 dots.

Graphics. Again, a consideration only for dot matrix and ink jet printers. Generally a yes or no question, it indicates whether dots in a matrix can be addressed individually to create graphics displays. Think carefully before you dispense with this capability—the time will probably come when you will miss it. For example, without graphics capability you will have trouble listing programs that include control characters.

Character sets: Again, a feature pertinent only to dot matrix and ink jet printers. Specifies the number of built-in fonts the printer can generate. Typically fonts are distinguished by their varying *pitches*, meaning their widths, which are measured in characters per inch, or *cpi*.

Buffer: The amount of text which can be stored in printer circuitry prior to actual printing. Some printers offer buffers up to 48K, so that an entire document can be dumped to the buffer, freeing the microcomputer to go on to other tasks while the printing takes place.

Logic-seeking: The ability of a printer to exercise some flexibility in advancing to the next printing position. Rather than an unwavering carriage return and line-feed at every end of line, a logic-seeking printer will determine which way is fastest, and then take that way. *Bidirectional* printing means the printhead can print from right to left as well as left to right. This does not always ensure a faster route, however, as in the example of a list of numbers running down the left-hand margin. A "smart" bidirectional printer would not make a mistake in this case, but rather print unidirectionally from the left-hand margin.

Noise: Another warning is in order here. For purposes of comparison, we used a noise level meter to measure the noise in decibels, during printing, one meter from each printer. We placed each printer on a noise-deadening mat of foam, as we assume the noise-conscious consumer would do. The numbers presented here indicate the results. They are best used for purposes of comparison only.

Price: This in all cases indicates the list price of the unit. Quite frequently the printer can be purchased for substantially less than the manufacturer's list price, however.

Overall rating: We have given each printer a rating of 0-4 stars, based on the ratio of its performance to its price. This approach has its faults, but it accurately reflects our opinion about the hardware. A rating of one star is fair-poor, two stars fair-good, three stars good-very good, and four stars very good-excellent.

With these explanations in mind, let's take a close look at some printers. Hold on to your fonts, folks.

The Seikosha GP250X is an example of the new under-\$500 generation of printers. It offers a tolerable dot matrix print quality with built-in graphics capability, and the capacity for paper widths up to 10 inches.

With a claimed speed of 50 cps, the GP-250X is not a speed demon, but it does offer a bi-directional, logic-seeking printhead. We dare say that speed will not be a major consideration for buyers of this printer. What will be a major consideration is that the Seikosha offers many of the features of much more expensive printers at quite a low price.

Dot-addressable graphics, for example, are standard, and resolve to 480 x 8 per horizontal row. A position feature allows multipass capability.

Indicator lamps signify power on and error conditions, while pushbutton controls are limited to stop and reset controls only. One serious omission is the lack of

an online/local switch, which would allow the printer to remain on but disabled. Whether the printer is on or off, may be a moot point, however, as paper, once fed forward, cannot be fed in the reverse direction. This is annoying, and takes some getting used to.

On the positive side, the printer does offer serial and parallel connection. The serial connection is via a 5-pin DIN connector, while the parallel connection is Centronics-style. A mode selection switch on the back of the printer selects for serial, parallel, or self-test mode.

Commodore offers a version of this printer as its new 1525 printer for the VIC-20 and Commodore-64 users. VIC and 64 owners should be aware, however, that the unconventional configuration of the Commodore 5-pin DIN is *not* compat-

ible with the orthodox pin array on the Seikosha machine, and so a custom cable will be required.

The GP-250X offers one English character set, with the option to expand it horizontally and vertically. It also offers special British, German, and Swedish characters.

As stated earlier, the printer is slow, and slow form feed bogs it down yet further. The lack of a linefeed button was also missed.

The unit is quite compact, and really quite stylish, though it suffers from a severe case of "plasticitis." Don't drop this baby on a concrete floor—you'll be sweeping it up with a broom. In all fairness—you cannot expect such an inexpensive unit to be housed in a super-durable case.

The printer ribbon is in cartridge form, but the cartridge is one of the harder ones to change that we have seen. Fortunately, the manual is quite clear on the steps involved in changing the ribbon cartridge. In fact the documentation in general is very professional, and much better than we might have expected with such a unit.

As far as noise goes, the unit came in with a quite noisy 69 dB. It has a characteristic raspy quality to it as well, which was judged to be quite annoying. But this is nothing compared to the paper empty warning buzzer, which sent us running in all directions, to duck and cover. That was a feature we could have done without.

This review may seem highly critical, and though the Epson MX-80 probably remains a better \$500 buy, the Seikosha is not a bad machine for the price. It merits a rating of two stars.

Okidata Microline 92

A Price/Performance Leader

One of the leading producers of small personal computer printers is Okidata. Their newest offering, the Microline 92, is a compact model which is nicely suited to household computer use.

The Microline 92 has a base unit sticker price of \$699, making it a reasonably priced printer considering its performance

capabilities. The basic printer has four built-in character sets and a 2K print buffer, and boasts a top print speed of 160 cps.

When using the 92, you select between pin and friction feed. If you are using the pin feed rollers, the printer will accept only 10" fan-fold paper. The printer can be loaded from the top as well as from underneath. There is a small bracket located on the top of the unit which keeps the paper from wrapping back down inside of the feed slot—a common problem with other printers.

Hooking up the Microline 92 to your computer is very easy. The printer can be ordered with either a serial or a parallel interface. The one we reviewed had a Centronics parallel connector located on the back of the unit.

One thing that annoys me about the Microline 92 is that the entire casing must be removed to gain access to the DIP switch on which you select the various print options. Granted, there are only two screws that must be taken out, but we would rather not have to tear the printer apart every time we want to change an option.

The printhead has a density of 13 x 7 and can print 160 cps in the data processing mode, 50 cps in correspondence mode. The Microline 92 prints bidirectional and has true logic-seeking functions. Many people believe that these two

features make a printer fast, but the speed of a printer is really determined by how well it handles paper during throughput. The Okidata performs well in this area.

On the front panel of the Microline 92 there are four buttons, three lights, and a rotary dial. All of these are clearly labeled. The button second from the left is the "select" button. Hitting it switches you between on-line and local modes. To set the top of form, hold the TOF button down and move the paper manually to the desired position. Hit the form feed button at any time while you are in the local mode to advance the paper to the top of the next page. The rightmost button is the linefeed button.

If the printer runs out of paper, a red light on the front panel lights up and the printer stops. When the unit is on-line, the light above the select button is lit. So that you don't have to guess whether the printer is on, there is an easily visible power indicator located on the front panel. As long as the unit is plugged in and current is running through it, this light remains lit. The rotary length dial can be set to any one of ten positions. User-selectable form lengths range from 3" to 14".

The dot matrix print quality is very nice compared to other printers in the same cps range. There are four character sets, each with 96 characters, and the lower case letters have true descenders. In correspondence mode, the dots that make up each character are very close together, almost giving the appearance of fully formed characters. This printer uses an open spool ribbon which is difficult to thread and not as easy to handle as a cartridge ribbon found on other units.

For a printer of its small size, the Microline 92 is rather noisy. The Okidata clattered in with a raspy 72 dB noise level while printing. Although this is acceptable for a home environment, we wouldn't want to be on the phone in an office while it was printing. When the Okidata is turned on and waiting for you to use it, it makes no noise whatsoever. This is an appealing factor to those who like quiet while working on their computers.

The Okidata Microline 92 is basically an enhanced version of the Microline 82 with the control codes of the Microline 84. Special features such as super- and sub-scripting make the 92 a perfect printer for the serious beginner. The printer is light-weight and very compact, and has a solid build. Its main market will probably be the home computer owner, since it has only limited office features. If you are looking for a reliable, quality printer for under \$700, check out the Microline 92. It rates four stars.

MPI self-portrait.

Unfortunately, interfacing to your specific machine may be tricky. Serial and parallel connection is offered, but only through a highly unorthodox internal connector. Apple owners will note with interest that MPI sells a cable, card, and software kit tailored specifically for connection to the Apple. This makes parallel connection a snap. MPI also offers a serial interface adapter. Our advice would be to forego the excitement of wiring this yourself. Take advantage of the ability to buy it directly from MPI.

The print quality of the PrintMate 99 is about average, but the graphics capability is well above average. The printer seems to have been designed with graphics applications in mind. The documentation is especially thorough in discussing graphics options.

As for its noise reading, the MPI unit turned out to be among the noisiest we tested. If a printer came in under 70 decibels, it passed our informal noise test. At 71 dB, the PrintMate 99 is among the four printers that failed, gaining the label "really pretty noisy." It is the kind of printer that stops arguments, shortens phone calls, and sends the cat into another room. This is its most disappointing feature.

The cartridge-based ribbon is not too difficult to replace, and the change can be made straightforwardly, without inking up fingers. The buffer is a slightly skimpy 1K. We rated the unit at three stars.

8510A Prowriter

The Competition Is Running Well

If any low priced printer has a real shot at the reputation of the Epson, it is the C. 10th Prowriter, and it is catching on fast. The unit we received several months ago quickly became the favorite of one of our colleagues. We can comment on the reliability of this machine: in four months of heavy use, it has yet to exhibit the slightest problem. The Prowriter is a real workhorse, deserving of its growing reputation.

Though we are not wholly sure it lives

up to its maker's claims of up to 120 cps, we can report that it is faster than most other impact dot matrix printers in its price range. At this speed, it delivers a crisp and classy 7 x 9 character set (but one of seven it can produce). It also offers bit addressable graphics.

The unit we received had a Centronics standard parallel connector, and was quite simple to get going. A self-test feature is another added convenience. The cartridge ribbon is easily replaceable, and paper handling is about average, with familiar pinfeed, or friction feed for single sheets.

The offer comes with a slightly paltry 1K standard, and the option to go to 3K. Front mounted LEDs indicate power on, paper empty, and on-line status. Push-buttons allow for manual selection of on-line/local status, linefeed, and top-of-form

access. These features add to the ease of use of the unit. The Prowriter is a sturdy machine, designed to keep costs low while maximizing reliability. Reliability is a feature that can't be ignored. The noise level of the Prowriter was measured at 69 dB, which is noisy but tolerable.

The documentation is unfortunately somewhat lacking. Its outward appearance is professional-looking, but the information it contains is spread all over the place, in a rather unorganized manner. We will say that nearly everything you need to know is in there somewhere (along with lots you'll never need to know), but good luck finding it when you want to. It could have been done much better.

It is probably somewhat unfair of us to site the reliability of this machine, in light of the fact that the other printers have not been around long enough to allow us to pass similar judgment. But in our opinion it is a judgment worth passing on, and worth four stars in the bargain. We like this machine, and recommend it.

IDS 480 Microprism

Talk About a Look-Alike

Isn't that an MX-80 sitting there? Nope. wrong. It's a Microprism 480 from Integral Data Systems, better known as IDS. And at a list price of \$799, it offers yet another alternative to its Japanese twin.

The 480 offers most of the same features as the Microline 92, MPI 99, Prowriter, and other machines in the same price range. It features parallel and serial connections available on a single DB-25 connector. With a matrix density of 24 x 9, the print is very clear and pleasing. We like a font that includes serifs, as it more closely resembles fully formed character type. The Microprism default character set, while clearly dot matrix, does begin

to approach that most famous of printer buzzwords: letter quality. And it does so at claimed speeds of up to 110 cps.

Single sheet friction feed, as well as pin feed are available on the 480. While single sheets feed well, we found the pin sprocket clamps awkward and liable to an occasional jam with fan-fold paper. Perhaps the paper we were using was simply too light for this machine.

The unit is a serviceable home printer, but certainly not a machine one would place in a busy office environment. It is on the "plasticity" side, and unlikely to survive extended abuse of any kind. Again, these are comments we would probably make of our venerable measuring stick, the MX-80, as well.

The Microprism was rated at 66 dB, which puts it among the quietest of the printers we tested, and makes it far and

away the quietest printer we tested that lists for under \$1000. This is probably the strongest point of the machine.

CIRCLE 404 ON READER SERVICE CARD

Smith-Corona TP-1

Hey, Where's the Rest of My Typewriter?

At a list price of \$895, which can be heavily discounted, the SCM TP-1 is one of the least expensive daisy wheel printers on the market today. Question: How have they managed to do it? Answer: By creating a typewriter with a microcomputer interface instead of a keyboard. And in doing so, some very significant trade-offs were made.

Let's get the bad news right out into the open, then present the positive side. We are unhappy about a number of things concerning the TP-1—things that make it use somewhat less than enjoyable.

First, is its infernal racket. Our measured rate of 71 decibels does not sufficiently impart the sense of dread that quickly overcomes anyone in the same room with a printing TP-1. At first it reminded us of the old clacking teletype in the city room, with Perry White shout-

ing "Great Caesar's Ghost" over the din. This image was short-lived, however. Within minutes it had dissolved into the roar of machine gun fire as our boys clawed inch-by-inch up hill 479. If you live in an apartment, running this printer for more than five minutes at a clip will constitute grounds for eviction.

Ah, and we're only getting started. Unavoidably tied to this slight problem is another, the extremely slow speed of the TP-1. Remember how we mentioned above that manufacturers tend to exaggerate speed claims concerning their machines? Well Smith-Corona claims no more than 12 cps for its machine, and that in itself is generous. So you see, you must add to the infernal din the eternity it will take to stop.

Under the hood.

A single-page, single-spaced letter will take up all of the five minutes allotted to an apartment dweller before the neighbors organize a vigilante group. Printing a 40-page document would most certainly qualify as cruel and unusual punishment. Taken together, the problems of noise and slow speed create quite a serious disadvantage. Though we joke here, in the long run it is really not very funny.

Then there are the petty problems. Like the fact that the printer is noisy even when it is waiting because of a low quality, high RPM fan that runs continuously. Like the fact that the printer can't run with its cover down. Like the fact that the unit throws off a lot of RFI (radio frequency interference). Like the fact that the unit cannot really handle continuous form paper, must be ordered in either 10 or 12 pitch models, and has a buffer of a measly 120 bytes.

Isn't there anything positive we can say about the TP-1? Yes, there certainly is. The print quality is impeccable—no dot matrix printer at even four times the price, yet comes close to the print quality of the TP-1. If fully formed character quality is what you are after, and you cannot afford anything else, then the TP-1 is the machine for you.

The cartridge ribbon is a snap to change. It is about the easiest changing ribbon we have seen. Likewise, changing print wheels is quite simple.

Daisy wheel printers are as a rule noisier and slower than dot matrix printers. They need not be nearly as slow or as noisy as the TP-1, but for the price, the unit still merits two stars.

Under the hood.

The unit has no serious disadvantages, though there is nothing special about it, aside from the keypad that comes as standard equipment. We did dislike the plexiglass cover of the unit, which seemed a lot cheaper than it should have been.

The manufacturer rates the pinhead at greater than or equal to 100,000,000 characters, which is an impressive claim. As for noise, the unit measured in at a very noisy 69 dB. Still, the PrintMate 150G is very competitively priced, and on that basis, we rated it at three stars.

Daisywriter 2000

Give Me Your Answer, True

The Daisywriter is our kind of fully formed character printer. It is relatively fast, relatively quiet, and relatively smart. It offers a 16K standard buffer, optional to 48K. It offers friction feed, with an option for tractor. Logic seeking, bidirectional printing, and efficient form handling make it a pleasure to use. And all of this comes for a list price of a mere \$1395.

We like nearly everything about the Daisywriter, from its sturdy construction to its very complete documentation. With its front mounted controls and a page length calibrator similar to those found on the Okidata Microline series, the Daisywriter would be as at home in an office environment as it would be, well, at home. Paper handling is very accurate, and paper is likewise a snap to load. The ribbon cartridge looks to be the same as the one used on IBM Selectric typewriter, and is just as easy to replace. The noise rating of the Daisywriter was 68 db, which was quieter than seven of the dot matrix printers we tested.

About the only thing that got us down concerning the unit was hooking it up. It makes use of a 50-pin edge connection via a custom cable. Surely they could have done a bit better than that. Also, the

machine is a little more plasticky than we would have preferred. Plasticitis is an insidious disease—it is striking everywhere nowadays.

The print quality, as with other printers of its ilk, is unbeatable. And unlike the TP-1, any one Daisywriter can handle both 10 and 12 pitch daisy wheels.

More than the simple difference in their rated cps accounts for the fact that the Daisywriter is so much faster than the TP-1. The Daisywriter is smarter and handles paper much faster—these are considerations for which cps has not been known to account.

How unfair of us, you may be declaring aloud, to compare the TP-1 so unfavorably with the Daisywriter, without taking into account the disparity in their costs. The point is well-taken. What we are attempting to argue for is the following: if for your purposes true letter quality is mandatory, make the expenditure not only for letter quality, but for printer quality as well. The features available in the Daisywriter would have cost well over \$2000 only about a year ago. They are well worth the cost of a Daisywriter.

If it had a Centronics connector, or a little less plastic and a little more metal, we would have rated it at four stars. As it is, it receives a well-deserved three.

Okidata Microline 84: overpriced?

Rather than lauding into a refresh. We suggest you take a look back at the 92 review to recall the major capabilities offered by this machine.

The most special feature of the 84 is its overhead tractor, which greatly facilitate paper positioning. This tractor assembly is shipped as a part of the standard package, but is left as an option to be installed by the user. If you will be feeding only cut sheets into the printer, you will not need the tractor assembly. But for continuous forms, installation is absolutely necessary. It takes only a few minutes and is well explained in the documentation.

As with the 92, the ribbon is spool mounted, making a ribbon change somewhat inconvenient. Paper feed can be from the back or through a slot on the

Integral Data System Prism 132 Printer

One of the newest advances in the home computer field is the introduction of four-color printers. The Prism 132 printer from IDS has the ability to make hardcopy screen dumps of hi-res color graphics in addition to producing high quality character printouts.

The 132-column Prism we reviewed came equipped with two options which make it possible to use the color graphics capabilities of the printer. These options are the Prism Color board, and the Dot Plot Graphics chip. Combined, these two options boost the cost of the printer by \$498.

The Prism Color option gives you the ability to print standard text in any of the selectable fonts, using a four-color ribbon for highlighting or emphasis. The Dot Plot Graphics option can be coupled with Prism Color to allow you to print color dot-addressable graphics. Neither option is needed to run the Prism as a regular printer.

The basic unit price of the Prism 132 was recently raised to \$1499 because the new printers have been enhanced by the addition of extra features. One reason for this increase is that new Prism print buffers have been enlarged to 3.4K. In addition, IDS has made their Sprint speed-up option standard on all modes. The manufacturer claims that with the Sprint kit installed and selected, the printer can spit out 200 characters per second. This is quite an improvement considering that the old unit had a 110-150 cps ceiling.

The Prism 132 offers both serial and parallel interfaces using a single DB-25 connector located on the back of the system. When properly interfaced to a microcomputer, the Prism is simple to use and understand. The adjustable tractor can be set to accept paper from 3" to 15" in width making it possible to print on mailing labels, as well as the largest fan-

fold paper available. All paper is loaded from the rear, toward the very bottom. Like other printers which are fed from the back, the Prism has a tendency to wrap the printed paper into the loading slot unless you take care to drape it over the front of the unit.

After hooking up the Prism to our Apple II+, we decided to make a color screen dump of a cartoon that had been submitted on a diskette. We simply loaded the binary screen file into memory and consulted the manuals to find the correct commands to activate the printer.

In the four-color graphics mode the printhead starts on the left. It prints the first color on the ribbon, and then returns to the start of the same horizontal line. Once the printhead is repositioned, the ribbon is raised so that the next color to be printed is in front of the printhead. This cycle repeats until all four colors

have been printed; the paper is then advanced.

It took only a few minutes for the printer to finish the entire medium-sized screen dump. We were impressed—the registration of the paper was so good that there were no gaps between lines of print. The colors all came out vividly and sharply. The Prism is such a convenient way to get “photos” of hi-res graphics screens, we had to remind ourselves that it can also function as a high-speed conventional printer.

Prism printers have the ability to print 150 cps. The characters are dot matrix with true descenders, and the matrix has a density of 24 x 9. The quality of the printed characters is very good—the dots are so close together that the letters almost appear to be fully-formed. When the Prism runs in draft (Sprint) mode, it can print over 200 cps, but quality is sacrificed.

Resident in the basic Prism printer are seven international character sets plus the standard U.S. character set. To select a character set other than the default, you can either reconfigure the printer with a jumper or change a parameter through software.

Other specifications that you can configure through software include print density, fixed and proportional spacing, just-

fied text, intercharacter spacing, and line spacing.

The Prism is well padded on the inside in an attempt to reduce the noise while printing. When running at full speed with all of the covers in place, the Prism emits a noise level of 68 dB. This is slightly above the average we found for other dot-matrix printers.

The Prism 132 is a very versatile printer with many things going for it. The main appeal of the unit obviously is its ability to print four colors and hi-res dot-addressable graphics. If you have a need for computer generated charts or pictures,

Pkaso Interface Card

Lately we have been making extensive use of the Prism printer to obtain Apple II+ color hi-res screen dumps. None of this would have been possible without the aid of the Pkaso Apple interface card from Interactive Structures.

The interface card allows you to use the dot-addressable color graphic features of a fully equipped IDS Prism printer. Although Integral Data Systems has yet to introduce their own Apple interface card, Interactive Structures has had the Pkaso card on the market for several months now.

The Pkaso interface card has special features which similar products do not. According to the manufacturer, only the Pkaso has the ability to produce both low- and hi-res color screen dumps, all of which can be printed in a variety of shapes and sizes. The Pkaso printer interface is very impressive when you realize it can also handle gray-scale.

The small Pkaso interface card for the Apple II+ costs \$175 and comes complete with a 4' cable, a disk of software, and a 52-page user's manual. A similar package for the Apple III costs \$205.

The Voltector

The VOLTICTOR® plug-in power conditioner adds the positive, high-performance surge protection and filtering that most manufacturers have left out of their equipment. And, when computer manufacturers include protection it is usually not enough. They generally safeguard their equipment for "typical case" power line pollution, since it is uneconomic to design for "worst case" conditions. The VOLTICTOR® protects your equipment against "worst case" conditions, paying for itself many times over by reducing data loss and costly down time.

Qantex 7030: the Mercedes of matrix.

Siemens PT80/2712: nearly affordable.

this printer with the special options would be an excellent choice. The base price is a bit too high if you need only a conventional printer. Nevertheless, if you buy an IDS for its graphics capabilities, you need not purchase a separate printer specifically for text hardcopy.

We rated it a four star value.

Anadex Silentscribe DP-9620A

An Office Workhorse

The Silentscribe is easily the most impressive-looking printer we have ever seen. It looks like some sort of vehicle that is about to fly off the table and into deep space. But beauty is only shell-deep, you know. And with a list price of \$1845,

the machine has a lot to live up to.

First there is this silence business. The Silentscribe measured in at 64dB, which is admittedly the quietest of all the conventional printers we tested. But 64 dB is not silence, nor quiet, nor even a low rumble. It is noise. When the phone rings next to Silentscribe, you'll want to turn the printer off.

The Silentscribe is an extremely solid and well-built machine, giving the appearance of a unit with high reliability. It is also quite intelligent. In the self-test mode, it lists in binary the default configuration of all DIP settings. This is an advanced and very thoughtful feature. The Super-scribe will notify you of all switch settings as well as checking its own ROM and RAM.

The machine is another bottom-only loader, necessitating a slotted stand, and making paper loading somewhat inconvenient. Tractor feed, once established, is rapid and sure.

Print quality is quite good, approaching letter quality. There is easy access to all front panel controls, but the rear DIP switches are another story. They are recessed into narrow slots in the bottom rear of the printer—designed to be set once and then forgotten, I suppose.

The buffer is only 1.5K, with an option to expand to 2K. This is surprisingly small.

The Silentscribe is without a doubt a high quality machine, but for nearly \$2000, one might have expected more (as we shall see). For that reason, we gave the unit a rating of two stars.

quality in an American-made product? That's easy: the Qantex 7030 printer. Sure, it lists for \$1995, but what would you be willing to pay for a machine that is really built to take it, while producing state-of-the-art, truly letter quality dot matrix print at a rate of 37 cps? If we were shopping for a quality printer on which to heap some real abuse, this baby would be our choice.

Qantex under the hood.

Talk about metal. This printer makes use of metal. Remember metal? That's the stuff they had to use before there was plastic. The Qantex uses it, and uses it liberally. We have never seen a more solid machine. Its cover slams like the door of a BMW.

Offering parallel and serial connection in our preferred Centronics and DB-25 formats, the unit provides very clean print varying from 37 to 180 cps modes. The claimed 150 cps mode looks about as good as the 60 cps mode on other dot matrix printers. At 75 cps, we gained serifs and a very tight matrix. At a dual pass 37 cps, we got a matrix nearly indistinguishable from daisy wheel print. Examine it yourself. It is really quite impressive.

All options are easily selected from the front or rear of the printer. There is relatively easy access even to the configuration DIPs, which we found extremely refreshing. Paper can be loaded from the front or the bottom, very simply and

IT STARTED OUT AS A GAME

Nice and friendly. Just a couple of robot buddies tossing shotputs back and forth. But time passed, and a pleasant pastime turned faster, more intense, more deadly. No more tossing back and forth. Throw it hard! Throw it fast! Throw it past your opponent! And still the game got tougher. The robots added a wall of moving neutrons and wore side lasers to scoot from

side to side to protect the force fields behind them. They exchanged their shotputs for devastating energy balls. Survival took over for competition and exercise. Each shot became a matter of life and death, no longer friendly fun. Faster, faster and faster yet, they moved from side to side, firing, blocking, and firing again until too late. As the shots penetrated

their force fields, their power sources short-circuited and they disintegrated. No more friendly game of catch. It's now WALLWAR! Runs on 40K Atari 800 disk. Available from your local computer store for \$29.95 or order directly from:

The 7030 is a tractor-only printer—which seems a shame in light of its incredible print quality capability. Its noise rate was measured at a tolerable 67 dB.

The documentation is thorough and clear. Programming the printer is made easy.

If you are looking for speed and high quality print in a high quality printer, look no further. The Qantex is exactly what you are looking for, assuming you can afford it. And it's made in the USA. It gets three stars. It will get another when it drops \$400 in list price.

Siemens PT80/2712

Its Time is Nearly Here

You may have noticed that we have been using the phrase "under the hood" to caption photos of printer innards. The cover of the Siemens 2712 (nee PT 80) truly opens up like the hood of a car. It's only fitting, too: the printer costs practically as much as a car, listing for \$3225. This price will surely drop—at least we expect it to—as ink jet printer production expands.

When we first examined the print quality of the Siemens unit, we were unimpressed. The matrix seemed blurry and ill-defined. We then learned from the thorough documentation that the print-head must be cleared at the start of each printing session. This is accomplished very simply by allowing the self-test to run for a couple of minutes so the print-

head jets can clear up, evening their flow. The print quality then improves dramatically, though it always remains recognizable as dot matrix.

Rather than print quality, the really impressive things about the Siemens unit are its speed and its noise rate. At a staggering 270 cps, with a very quick linefeed, the unit registered 55 decibels. This represents a noise level of less than half that of nearly all the other printers we have examined. The sound is more like that of the windshield wipers in a Volkswagen than the sound of a micro-computer printer.

The ink jet head itself is very easy to remove, though as one might expect, the ink can be somewhat messy. However the manufacturer states that the life of an ink cartridge is typically greater than or equal

Siemens under the hood.

A Truly Pretty Printer

In July of 1982, Sanyo introduced a portable computer called the PHC-8000. It is a multi-featured handheld machine, aimed squarely at the data communications market. On a recent visit to Sanyo, I got a chance to look at it, along with some other goodies the company is readying for release.

Among these was an utter jewel—a truly exciting new product. It was a printer prototype called the PHC-8000P, although I was warned that the model number might change soon. Granted it is remarkable enough that the PHC-8000P is an impact printer that will list for under \$500. The really interesting thing about it is its diminutive size: a mere 12 x 7 1/2 x 2 1/4" (see photo).

Although designed to complement the PHC-8000 handheld unit, the PHC-8000P will sport a Centronics-compatible parallel connector, for easy interfacing to other microcomputers. I saw a working prototype smoothly handle 8 1/2 x 11" single sheet bond paper, and produce letter quality print at a rate of 20 cps, which is a bit faster

The PHC 8000-P is the smallest fully-formed character printer ever offered.

than many full-size fully-formed character printers. The unique, barrel-shaped plastic print head produced unerring character registration, though the printer proved a bit noisy during use. This is an understandable trade-off considering its extremely small size.

With its incredible portability and very reasonable price, the Sanyo PHC-8000P may become one of the year's big contenders. It could usher in yet another revolution to an already fast-changing market.

Yukio Sakaguchi, Project Engineer, and one of the designers of the unit. To his right is Arthur Shebar, Sanyo's national Sales Manager.

The PHC 8000 is the handheld personal computer that mates with the PHC 8000-P, although interfacing other machines will be possible.

to 5,000,000 characters. That would mean the printhead would need replacement quite infrequently.

As for the reliability of the unit, frankly we would feel a bit queasy laying out so much money for a technology so new. We had some problems getting the machine up and running—problems ranging from an ill-fitting power cord to faulty interfacing information from customer support. Though these problems were solved very quickly, the indication is that the bugs aren't totally out yet. We guess that at press time only about ten people in this country, perhaps fewer, were truly qualified to service the Siemens unit. That is not enough of a support organization to satisfy us.

Ink jet technology is nonetheless here to stay, and the Siemens PT80/2712 printer will probably be with us for quite a while as well. It certainly runs like a charm now. It merits a two star rating. □

WE'RE WRITING

THEM AS FAST AS WE CAN!

At the rate we're going, we'll have these pages filled by 2083. And by 2084, people will be clamoring for the next Infocom creation.

We hate to disappoint our public. So we keep you waiting. Because while the software factories are cranking out arcade game after arcade game, pulpy adventure after trite fantasy, we're writing and rewriting, honing and perfecting. Before a single person enters one of Infocom's worlds, it must be crafted into a living, riveting, definitive experience.

Judging from the public's reaction, it's worth the wait. For instance, *Creative Computing* welcomed DEADLINE™ as "thoroughly engrossing and realistic," while a *Softalk* readers' poll recently voted ZORK™ I and ZORK II the most popular adventures of 1981.

And now, for the moment, your wait is over. ZORK III, your final

step in the underground trilogy, and STARCROSS™, an exploration of a new dimension in science fiction, are ready for you.

Look at them up there, the little worlds of Infocom. As our universe expands, companions will come to help fill that vast expanse of white space. Till then, they'll continue to stand alone as the best of all possible worlds.

Quadram MicroFazer Data Buffer

David H. Ahl

Hardware and Installation

The MicroFazer uses a custom LSI chip and up to eight 64K bit RAM memory chips on a single board. It is possible to purchase the MicroFazer with just one chip installed (8K bytes) and then upgrade it with more memory later on. Quadram supplies versions of the MicroFazer with 8K, 16K, 32K, 48K, and 64K. You should choose a version with enough memory to handle the longest documents you normally write.

MicroFazer may be plugged directly into Centronics-compatible printers. You simply unplug the cable connected to the printer, plug the MicroFazer cable into the printer, and plug the computer cable into the MicroFazer.

If the printer you are using is not Centronics-compatible or does not use a G-520 36-pin connector, you will have to make or purchase modified cables. A block diagram of the MicroFazer including all connector pin designations is in the manual.

Power is supplied to the MicroFazer either directly from the printer or from an external 9v power supply. Some printers have power available on pin 18 while

others, including the Epson series, do not.

The manual includes a simple modification which allows Epson MX series printers to get power for the MicroFazer. You must remove the bottom cover of the printer, remove the top printed circuit board, and run a jumper from one of the resistor pins to connector pin 18. It is a simple modification but, unfortunately, voids the Epson warranty. If you don't want to do this you can, of course, use the external supply.

An external power supply is not furnished by Quadram but one can be purchased in most electronic outlets for \$5.00 or \$6.00.

The MicroFazer comes in two case styles, free-standing and snap-on. The snap-on unit measures a compact 3.5" x 7" x 1" while the free-standing one is slightly larger, 5.5" x 8" x 2". The snap-on unit bolts to the back of the printer. It has just one external control, a reset button. It also has a red LED which indicates whether it is ready to receive data. An internal slide switch is used to choose between internal and external power.

The free-standing unit also has a reset button, ready indicator, and external power supply switch. In addition, it has an LED which indicates an error condition (cable not plugged in, printer not

The Quadram MicroFazer is a self-contained data buffer that connects between a computer and a printer. The MicroFazer receives data from the computer at a high speed (up to 4000 characters per second). It stores these data in its own memory, then feeds the data to the printer as the printer can handle them. This buffering action means that you need not tie up your computer while printing a lengthy document.

Time Saving

Does the MicroFazer really save time? You bet. An article written in-house for *Creative Computing* is either transcribed by a secretary from a dictation tape on a word processor or written directly on one. This first draft is then corrected by the author and printed out a second time. It is then routed around to the other editors for comments, changes, and corrections. Following that process, it is printed out again.

One article I wrote recently was 4178 words long. A double-spaced printed version ran 17 pages and took 11 minutes and 40 seconds to print (about 40 seconds per page) on an Epson MX-80 printer. Do the arithmetic and you will find that this is a print speed of about 44 characters per second, slightly over one-half of the rated 80 cps speed of the Epson. We found this differential true across the board in our printer evaluations. Hence, speeding up the printing process may be more worthwhile than published figures might lead you to believe.

In any event, the 4178-word document was transferred to the MicroFazer in about 15 seconds. The computer was then no longer occupied with the printing process and was free to do something else. On the three printouts of this article, the MicroFazer saved 35 minutes of computer time, a significant saving indeed.

The computer time necessary for printing with and without MicroFazer is in a ratio of about 46:1 with Epson and other dot matrix printers in the 80 cps speed range. The savings are proportionately greater with slower printers and less with faster ones.

Unique Reading Series Motivates Students

Radio Shack's High Motivation Reading Series (HMRS) is based on motivational reading materials for levels 4-6 using an illustrated format. Four student readers and a read-along audio tape accompany the program. The computer measures comprehension in several skill areas, such as understanding the main idea, sequence of events, details, and separating fact and opinion.

Spelling and vocabulary exercises based on words from the story are also included in Model III versions. These exercises are repeatable—each session randomly selects a new sequence of problems from a large pool of possible words. Program requires TRS-80 MicroPILOT™ (26-2718 for Model III; 26-2205 for Model I).

Powerful Network 3 Controller

- Access Programs From Disk With Low-Cost TRS-80 Model III Computers
- Connect Up to 16 Non-Disk Student Stations To a Single "Host" Disk System
- Operation Is Virtually Automatic—No Need for Constant Teacher Supervision

Network 3 system requirements—Controller, Operating Software, and cables.
Minimum student station: 16K Model III with Model III BASIC and RS-232C Interface. **Line printer optional.**

The Versatile Network 3

The *Network 3 Controller* (26-1212, \$599) enables educators to design a Shared Learning System of up to 16 non-disk Model III student

stations connected to a disk-equipped "host" system. Student stations access the disk drives and printer of the teacher's host system, providing them with most of the same disk features that make a disk-equipped computer so powerful. A *Network 3 Shared Learning System* is not only highly cost-effective, but it eliminates the need for close supervision. And an optional line printer attached to the host system lets students get printouts without teacher assistance. *Network 3* is designed for use with the educational software packages indicated in this catalog by an asterisk (*). Other business or application packages may not be suitable for use with *Network 3*.

Network 3 Operating Software (26-2775, \$149) supports the *Network 3* host and its student stations with many of the capabilities of TRSDOS and Disk BASIC. It permits student stations to SAVE and LOAD programs directly to and from the host disk, and LPRINT to the host printer. Printer access requests are "spooled" at the host until the printer is free, so pupils can move on to the next project without delay.

Radio Shack Gives You a Variety of Helpful Educational Resource Materials

Our *TRS-80 Educational Software Sourcebook* (26-2756, \$4.95) is a special edition of the TRS-80 Software Sourcebook. Vendor-furnished listings include descriptions of programs, plus user site references.

The *TRS-80 Microcomputer Information Handbook for Educators* (26-2757, \$2.50) describes what microcomputers are and how they can be used in classrooms.

Radio Shack's Proposal Writing Guide (26-2754, \$9.95) is a guide for educators seeking funding from an outside source for computer-related education projects.

Network 2 Saves You Time

Radio Shack's *Network 2 Controller* (26-1211, \$499) lets teachers connect up to 16 non-disk student stations to a single "host" computer using the cassette ports. The teacher can up- and download programs to these student stations simultaneously. It requires a Model I or III host computer with disk drive and up to 16 Model I or III stations, or a Color Computer host with disk drive and up to 16 Color Computer stations. All cables are included.

Radio Shack Has a Complete Selection Of RS-232C Cables and Extenders

ready, etc.). A second pushbutton switch, labeled "Copy" is used to repeat the print operation with the data in the MicroFazer buffer. When this has been pressed, a red "Copy" LED is illuminated.

MicroFazer is available in three configurations, parallel in/parallel out, serial in/parallel out, and serial in/serial out.

If you are doing a really heavy volume of printing, two or more MicroFazers can be connected end to end to obtain increased buffering (128K, 192K, or more).

Another related product by Quadram is InterFazer which is described in the manual as "an intelligent controller/buffer that allows up to eight computers to be connected to one of two printers. Computers can be connected either through serial or parallel input ports and the printers can be serial or parallel. Inputs and outputs do not have to match."

Simple Operation

Once installed, the MicroFazer is invisible to the user. Upon powering up your system, you simply turn on the computer, printer, and MicroFazer. If everything is plugged into a switch-type power strip, one switch can bring up the whole system. The "ready" indicators on the printer and MicroFazer should both be on. If they are not, pressing the reset button on MicroFazer should bring everything to a ready state.

During printing, the MicroFazer reset button will clear the buffer and halt the print process.

As long as the ready LED is illuminated, you can send data to the MicroFazer. For example, if you are printing a long document and finish editing a short one, you can send it to the MicroFazer and go on to something else. Just be sure the second document starts with a printer form feed.

Summary

The MicroFazer saves a significant amount of computer time when printing long documents. With a slow daisy wheel printer (40 cps and under), the computer will be tied up for printing less than 1% of the time it would be without the MicroFazer. With a medium speed printer (80 cps range), the time saving is about 1 to 46, while with a higher speed printer (200 cps) the saving is still a significant 1 to 20.

MicroFazer is easy to install on most printers with parallel Centronics-type connectors or serial DB-25 type connectors. In normal operation, MicroFazer is invisible to the user.

The price of a parallel/parallel 8K free-standing MicroFazer is \$169; the snap-on unit is \$10 less. Both 64K units cost the same, \$299. MicroFazer is available in many computer stores or directly from the manufacturer, Quadram Corp., 4357 Park Dr., Norcross, GA 30093. (404) 923-6666. □

But won't take a huge bite from the budget.

Okidata's new multifunction Micro-line (ML) 92 printer is just the animal. It prints high resolution, correspondence quality text that's a match for any daisywheel's at 40 cps. Graphics and emphasized and enhanced printing at 80 cps. And bidirectional, data processing with short line seeking logic at 160 cps. Add an alternate, downline loadable character set, and you've got one heck of a printer. And there's an ML 93, too, that adds wide-column printing to the picture.

Both of our new high performers have no duty cycle limitations and feature the Okidata, 9-pin print head

It's the same old Apple II.

For years, people have been trying to build a better Apple® II. It finally happened.

Meet the Apple IIe, an impressive new version of a most impressive machine.

The "e" means enhanced. Which means a bundle of new features:

A standard memory of 64K (versus 48K) that's easily

expandable. So you can create fatter files and crunch larger numbers of numbers.

A new, improved keyboard, with a complete set of ASCII standard characters. Plus full cursor controls, programmable function keys, and a rapid auto-repeat feature built into every key on the board.

Both upper and lower case

characters. (And if you want to see more of them on the screen at one time, a low cost 80-column text card is available.)

Improved peripheral ports. Which make it a lot easier to connect and disconnect game controllers, printers and all those other wonderful things that go with an Apple Personal Computer.

Except for the front, back and inside.

Self-diagnostics. That's a special feature that makes it easy to give your computer a thorough check-up.

Plus an even more reliable design. Achieved by reducing the number of components—which is to say, the number of things that could go wrong.

And bear in mind, the IIe still has all those other virtues that made the Apple II so very popular. Including access to more accessories, peripheral devices and software than any other personal computer you can buy.

Word Processing On The Apple With WordStar and Diablo

When you use your Apple for word processing, do you find you are becoming increasingly frustrated by the limitations of your "simple" 40-column Apple word processing program? If so, at one time or another you have probably considered upgrading your Apple for serious word processing—specifically, by adding an 80-column card, a letter quality printer, and a professional word processing program.

This is exactly what I went through. At the time, I had been using Apple Computer's *Applewriter* program, Dan Paymar's lower case adapter and a Trendcom 200 printer for my word processing. Despite the many limitations of that combination (40-column display, words split across lines, and hard to read thermal paper outputs), I found I was using my Apple for word processing more and more often. In fact, word processing had become the main application for my Apple, exceeding even *VisiCalc*. I found my use of it for composing draft—copies of reports, memoranda, and letters saved me time and improved my writing. The ease with which text could be altered and modified on the computer made it easy for me to experiment with words—far easier than if I had used pencil and paper.

These gains in personal productivity spurred me to think how much greater my productivity would be with a professional word processing system. It was at that time I decided to turn my Apple into a "professional quality" word processing system.

I decided my upgraded system would consist of a Diablo 630 printer, a Videx Videoterm 80-column display, and

Jerry Mar

MicroPro's *WordStar* word processing program.

I chose the Diablo 630 because of its flexibility in handling both plastic and metal daisy wheel print wheels, and because it was the most established (i.e., been on the market for the longest time) of the second generation daisy wheel printers (lower cost printers using more electronics and fewer mechanics). I chose the Videx 80-column card because

of its relatively cool operation (it uses low power CMOS integrated circuits), its use of a 7 x 9 character matrix (its characters seem more readable than the other cards I had looked at), and because (at the time of my purchase) it was one of two 80-column cards directly supported in the installation procedures included with *WordStar*.

Although *WordStar* requires a Z80 SoftCard to be added to the Apple (to enable it to run CP/M programs), I chose it because of its reputation as the Cadillac of microcomputer word processing programs and because the final printout format (including page

Apple/Diablo, continued...

breaks) is continuously visible as text is entered.

Many of you may be considering such an upgrade, so let me describe what I went through to make it work. Let me say at the outset that my final system works very well, but getting there was anything but straightforward. In making such a combination work, one is faced with making five semi-independent computer systems (the Apple 6502, the SoftCard Z80, the controller on the Apple printer serial interface card, the keyboard/character processor in the 80-column card, and the 8085 microprocessor in the printer) work together. The

My final system works very well, but getting there was anything but straightforward.

whole process took several months of effort. I took many blind paths, made lots of mistakes, and spent more money than I needed to. Fortunately, you can learn from my experience and avoid my pitfalls.

What Not To Do

Because of my existing *Applewriter* text files and the considerable expense of the upgrade, I decided to do the upgrade in several stages. Since the most limiting feature of the *Applewriter*/Trendcom combination was its inability to generate letter quality reports, the first stage of my upgrade was to add a Diablo 630 daisy wheel printer to use with my existing *Applewriter* program. As you will later see, this was a mistake.

An RS-232C serial interface is needed to connect such printers to the Apple. Following the recommendations in my *Applewriter* manual, I purchased the Apple High Speed Serial Card for this purpose.

Now it turns out that Diablo 630 receive-only printers (printers without a typewriter keyboard) come in three versions. There is the bottom of the line version (Model R110, also called the OEM model) with a minimal three-button control panel. There is the middle version (Model R102, often referred to as the standard model) with a seven-button control panel and a full complement of warning indicators. Finally, there is the full-featured version (Model R104, which is the standard version upgraded with the W/P or Communications Option) with an eight-button control panel, built-in word processing commands and non-volatile memory (settings are retained even after power is shut off).

After some experimentation, I found my *Apple/Applewriter*/High Speed Serial Card combination would operate properly only with the full-featured Model R104 Diablo 630. Thinking that extra features would ensure compatibility with later word processing upgrades, I chose the R104 Diablo 630. With *Applewriter*, this combination worked superbly—however, as you will later see, it did not work well with *WordStar*.

I completed my upgrade when MicroPro released version 3.0 of *WordStar* for the Apple. In addition to buying that version of *WordStar*, I purchased the Videx 80-column card and the MicroSoft Z80 SoftCard. Since my old 9" Sanyo monitor was barely up to resolving 80 columns of characters, I also ended up purchasing a 12" NEC green screen monitor. Because *WordStar* (and most CP/M programs) are designed to be used with two-drive systems, I also added a second disk drive to my system.

Eager to make use of my new word processing capability, I proceeded directly to the installation of the program on my system. In *WordStar* this is done by running a special program called *INSTALL.COM*, which presents a menu-driven series of questions to the user. The selections chosen by the user configure the interface of the program to the hardware. Everything went smoothly until I reached the section on installing the printer.

In version 3.0 of *WordStar*, the Printer Selection menu includes a line for the Diablo 630. After I had selected that line, a message appeared telling me to select the ETX/ACK protocol in the next menu. The next installation menu was entitled Communications Protocol, and sure enough one of its selections was called ETX/ACK protocol. Obeyingly, I made that choice.

This menu was followed by the Driver menu which included such cryptic selections as CP/M List Device (LST:), CP/M primary Console Device (TTY:), Port Driver (direct I/O to 8-bit ports), and User-installed driver subroutines. After several readings of the manual I concluded that Port Driver was the correct choice, hoping that I was finished with this multiple-choice game.

My hopes were dashed when the program presented the first of the Port Driver selections: I/O and Memory Mapped. Rushing back to the *WordStar* manual, I looked in vain for some clue as to the correct selection. Finding none there, I searched for a hint in my Apple manuals. Somewhat hesitantly, I concluded that Memory Mapped was the correct choice.

That choice led immediately to the following series of questions: What is the

Output address in hex? What is the Output Status address in hex? What is the Input address in hex? What is the Input Status address in hex? These were followed by: What are the Output Port Bits for your printer? What are the Input Status Port Bits for your printer? At this point I knew I was licked and immediately sought help. In an escalating fashion, I went to my dealer, Diablo customer service, and MicroPro customer service.

I'll spare you the gory details. Let me just say that I got *different* solutions from each source, and that none of the solutions using the Port Driver selection worked. On reporting my lack of success, the majority of my sources told me that I should then specify: the Teletype-like selection in the Printer Menu, None Required selection in the Protocol Menu, and CP/M list device (LST:) selection in the Driver Menu. However, they warned me that this arrangement did not allow handshaking (i.e., would not allow the printer and computer to communicate both ways) so that I would not be able to send characters to my printer at rates greater than 300 baud.

The last arrangement did work, and worked at 1200 baud. However, desirable word processing print features

The first stage of my upgrade was to add a Diablo 630 daisy wheel printer to use with my existing Applewriter program. This was a mistake.

like bold-face and micro-justification (the *WordStar* approximation of proportional spacing) could not be used with that selection. I found these features were usable when the Diablo 630 selection was chosen in place of Teletype in the Printer Menu, however this installation had one problem.

With this installation, the program would not print properly in the single-page mode (this is where the printer stops after each page so that a new sheet of paper can be inserted.) The first page would print out perfectly, but after the paper change, succeeding pages were printed without any left margin. This happened at both 300 baud and 1200 baud.

After many more phone calls I was told that I should use California Computing's CCS7710A interface card instead of the Apple High Speed Serial Card. I tried that card and found I had

exactly the same problem, except this time I did run into problems when printing at 1200 baud. It appears that the Apple Serial Card pauses after groups of characters are transmitted. This slows data transmission sufficiently to enable the printer to keep up with the data. With the CCS7710A card, characters are transmitted in a more continuous stream and the printer is unable to keep up with the data.

The main problem turned out to be the printer. When I used a standard

The one other modification I would recommend for your Apple is the addition of a cooling fan.

(Model R102) Diablo 630 in place of the full-featured Model R104, the single-page problem disappeared. Thus my error was in buying the printer to run *Applewriter* first, since the combination needed to operate *WordStar* was different. None of my information sources, including people at Diablo, had suggested that this could cause problems.

What To Do

Having described what didn't work, let me tell you what did. As I indicated in the last section, the standard version Diablo 630 printer worked for me. As for a serial interface card, the CCS7710A card worked best. *WordStar* printing was significantly faster with the CCS7710A card than with the Apple

High Speed card, however additional connector rewiring (described below) is needed to use it. The Videx 80-column card worked fine, especially after I made the shift-key modification (connecting a wire from the shift key to pin 4 of the game connector).

In order to use the CCS7710A card at 1200 baud, it must be made to hand-shake with the printer. To do this, the following changes must be made. Pins 4 and 20 must be crossed (not shorted) on the printer cable, so that connector-pin 20 on the CCS7710A card goes to connector pin 4 of the Diablo and connector pin 20 on the CCS7710A to connector pin 4 of the Diablo. This can be done by rewiring one of the connectors on the cables (not the card or the printer).

In addition, pins 5 and 6 on the internal "A60" jumper-block inside the Diablo printer must be shorted. This jumper-block is located on the top edge of the HPRO5 card inside the printer. To get at this block you must first remove the outer case and the internal shield cage surrounding the card. If you have difficulties with these changes, have your dealer do them for you.

Before beginning the installation of *WordStar*, you should use your CP/M utility disk to rename the *WordStar* file WSU.COM to WS.COM. If you do the renaming after installation (as suggested in the installation instructions I received with my copy of *WordStar*) you will not be able to run a program from the No-File Menu, which means you will not be able to check the amount of empty disk space while in *WordStar*.

As for the *WordStar* printer installation, the following worked for me. In the Printer Menu, choose Diablo 1610/1620

instead of Diablo 630. If the Diablo 630 selection works for you, you can also use that. However, when I selected that in my version of the program I lost the last line (usually the page number) when printing in the single-page mode. In the Communications Protocol Menu, select None required, and in the Driver Menu, select CP/M List device (LST:).

This should make your Apple a functioning *WordStar* system. However, since *WordStar* makes multiple uses of many of the standard keyboard keys (via CTRI key combinations), I have found labeling the keys to be very helpful. *WordStar* comes with stick-on key labels.

The one other modification I would recommend for your Apple is the addition of a cooling fan. The addition of the 80-column card and the Z80 SoftCard increases the power dissipation in the Apple enough to raise the internal temperature significantly. Perhaps it was merely a coincidence, but within a few months after my *WordStar* upgrade I had two separate incidents of component failure before adding a fan (the only failure in two years) and none since adding a fan. Based on an approximate measurement of internal temperatures, the fan reduced the inside case temperature from approximately 100° F to 80° F.

How Well Does It Work And Was It Worth It?

With the combination described above, *WordStar* operates very competently on the Apple II. All of the *WordStar* features (such as underlining, microjustification, boldface, and tabbing) are usable. The ability to see exactly how my text will be printed as I

Both the speed of my writing and the appearance of my final documents have improved greatly.

enter it has been exceedingly useful. I can easily tailor my text and tables for the best appearance on a page. The productivity improvements I had hoped for with this upgrade were fully realized. Both the speed of my writing and the appearance of my final documents have improved greatly.

However, the system is by no means perfect. There are several annoying features, most of them related to the limitations of the Apple keyboard. For one, symbols like square and curly brackets are missing, as is a tab key. The lack of

Apple/Diablo, continued...

programmable function keys is also a negative. Such keys would have been useful for simplifying frequently used multiple-keystroke commands.

A particularly annoying feature is the delay between commands and screen response. Cursor moves in response to tabbing seem to take an inordinate amount of time. As a result, when moving across multiple tabs, it is extremely easy to overshoot the desired position. Likewise, when deleting by continuous backspacing (using the REPT key), the cursor continues to delete characters several seconds after the finger is removed from the backspace key. The column and line numbers also have trouble keeping up with autorepeating movements.

The autorepeating function often requires three keys to be depressed simultaneously (e.g., CTRL, E and REPT keys must be held down at the same time to move the cursor up continuously, an operation that can be done on some computer systems with one key).

One last keyboard annoyance related to the use of the ESC key is the upper/lower-case shift-lock (at least when using the shift-key mod). Since many of the WordStar commands also end with a depression of the ESC key, inadvertent shifts often occur which must be unlocked with an extra depression of

the key. Some of the above keyboard deficiencies can probably be corrected by adding the Videx Keyboard Enhancer, but I did not try that combination.

The other area that could have been nicer is the video display. Screen scrolling, particularly downward scrolling, occurs jerkily (the screen updates long after the key is depressed). This seems to be a result of the relatively long time needed to rewrite the screen (close to three seconds when scrolling downward). Screen highlighting is also not available with the hardware combination. Had this feature been available, the WordStar display on the Apple would have been easier to read—especially when mixing soft and hard hyphens, and performing block operations.

On the plus side, despite the lack of special keys, the crisp action of the Apple keyboard makes it quite comfortable to use for word processing. In addition, what keys there are are placed in logical locations (more so than in several other computers with more keys). Although the video display lacks features, it is very clear and easy to read. As a consequence, one can learn to live quite comfortably with the above deficiencies.

An important word processing plus is the fast printing when using the

CCS7710A card. With this card, WordStar prints faster on the Apple than it does on many other CP/M computer systems using the Diablo 630.

An added bonus from the upgrade was the enhancement of the other applications of my Apple system. Basic-80, supplied with the Z80 SoftCard, is a significant upgrade from AppleSoft Basic. The second disk drive had made it much easier for me to back up my disk, and greatly improved my use of Pascal. The 80-column display makes it much easier to do programming (in Basic and Pascal).

The total cost of my upgrade counting the additional disk drive and monitor, but not counting the Diablo 630, was approximately \$2000. The Diablo 630 adds another \$2500.

So was it worth it? If one is starting out fresh (with no Apple), this approach to WordStar is more expensive than several alternatives that are probably better suited to word processing. However, if you already have an Apple with one or more disk drives and lots of application software, then this is an attractive way of obtaining professional quality word processing while enhancing the general capabilities of your Apple.

Did You Hear the One About the Computer That Talks?

It's no joke.

With the ECHO speech synthesizer from Street Electronics whatever you type on the keyboard, your computer can say. The ECHO's text-to-speech system gives your computer an unlimited vocabulary while using a minimum of memory. And now a diskette of fixed, natural sounding words is available to enhance the ECHO II's voice output.

Nearly 400 language rules are contained in the ECHO's text-to-speech algorithm. These rules enable the computer to pronounce most correctly spelled words. When in the text-to-speech mode the user can select any of 63 different pitch levels, and have words spoken either monotonically or with intonation by using simple control character sequences. The rate of speech can be fast or slow; words can be spoken in their entirety or spelled letter by letter. The ECHO's also pronounce punctuation and numbers. Words can be encoded using phonemes and diphthongs when the text-to-speech or fixed vocabulary is not required.

Applications are unlimited, ranging from phone answering, educational and training programs, to games and aiding the sight and speech impaired. The ECHO is a complete stand alone unit which is compatible with most any computer; it sells for \$299.95. The ECHO II, which plugs into the Apple II, is priced at \$149.95.

Three Word Processors For The TRS-80 Color Computer

Let's get the tone of this thing right at the start: I expect to enjoy writing this review, I hope it will be helpful to a few people, and I certainly don't intend it to be an anti-Radio Shack diatribe. That said, I feel compelled to present a bit of history.

Many of these people have produced really useful software for the Color Computer, and two such independently-authored packages, *Telewriter* and *C.C. Writer*, figure in this piece. Radio Shack has come around, too; their word processor, *Color Scripsit*, has to be considered a real contender.

Word Processors, continued...

The conventional display is 32 columns by 14 or 15 lines; one or two lines are reserved at the bottom for status information. When the line length is later reformatted for printing, *Scriptit* shows you how the text will appear. The video display then becomes a 32-column window which can be scrolled horizontally as well as vertically.

C.C. Writer takes a very different tack. It is a line-oriented system which assigns a reference number to every sentence. You must remember to terminate every sentence with an Enter command, rather than typing your text continuously. The program inserts spaces between sentences when printing the text, of course.

With *C.C. Writer*, text entry and editing are completely separate operations. The sole exception is your ability to edit the current sentence before hitting Enter. You can backspace to correct an error, although this erases anything typed after the mistake was made. Once material has been entered, you must leave Enter mode, return to the main menu, and select one of two other modes: Edit, for working within one sentence at a time, or Insert/Delete/Move, for performing one of these three operations on a complete sentence or

C.C. Writer uses the standard Color Basic font, with reverse video denoting lower case.

group of sentences. The Edit mode also has Insert, Delete, and Change sub-modes.

This is beginning to sound much worse than it really is. In practice, you return to the main menu by typing Slash-q (that's right, Slash is the *C.C. Writer* control character), and thread your way through a couple of prompts to arrive at Local Edit. If you know the reference number of the sentence on which you want to work, you specify it; otherwise, keep hitting Enter to invoke the Line Seeker, which allows you to use the arrow keys to scroll up and down through the text. When you find the target sentence, Enter re-invokes the editor. Now, you can move the cursor to the desired position and use i, d, or c to insert, delete, or change material.

A prompting line keeps you informed as to which mode or sub-mode is in operation at any time. Insertion works just as for *Scriptit*; deletion is performed one

character at a time by depressing the d key, and change is an overtyping operation. You must work your way back to the main menu eventually, but this is made easy by the generous use of prompts.

Large chunks of text must be deleted one sentence at a time. The Delete option of the Insert/Delete/Move command is selected, and you are prompted for a line number. If you specify one, the computer prints the line and asks you to verify your intent to delete it. If you agree, the line is killed and you are asked to specify another. If you have specified the wrong line, a negative answer saves it and returns the prompt.

Incidentally, only the cassette version of the program uses the three-way Insert/Delete/Move. The disk version has separate commands for each of these options.

C.C. Writer uses the standard Color Basic font, with reverse video denoting lower case. Relatively little text is visible at any one time, because of the start-of-line prompts and reference numbers.

Embedded Commands

Word Processors must provide for embedded commands—special instructions for modifying the text format as it is printed. These must be incorporated into the text, and the program must recognize them as commands and execute them without printing their literal form. Special control characters are the order of the day.

Teletwriter uses the Clear-Period combination to generate a small carat, which can be followed by one or more commands. The commands themselves are much the same as those used by the print formatting menu, namely a capital letter followed by a number. For example, M20 resets the left margin to 20 spaces, and C40 tells the printer to switch to 40-character lines.

Embedded commands must appear on their own lines, without other text, and must be indented by at least one space. You can "stack" several of them on one line, and there is no particular order in which they must appear. There is a fairly complete set of such commands, including five which control the fonts of an Epson MX-80 Printer, and provision has been made for the user to define his own commands. These would normally be strings of ASCII control codes to be executed by the printer.

The embedded command syntax is also used for a few other purposes: centering a line of text, aligning partial lines with the left margin, or defining a header to be printed at the top of each page, for example. One thing which *Teletwriter* unfortunately does not provide for is the setting of tabs. It comes

with predefined tabs every eight positions, which is really too much for indenting a paragraph. You must, therefore, punch the spacebar five times or so to get indentations.

Color Scriptit is a little less versatile in this area. You can set tabs, center a line, define headlines and footers, and change from left to right-justification, but that's about it. Line length, and margins, to mention a couple of major parameters, can be set only once for the entire document. This is unfortunate, because a standard method of setting off a direct quotation or other material is to print it with wider margins (shorter lines) than the main text, perhaps single-spaced in an otherwise double-spaced manuscript. You can adjust the margins with judicious use of tabs, but is not convenient.

The embedded commands in *Scriptit* are set with the Break-number key combination. Tabs are set by spacing over the desired distance and hitting Break-5, for instance. The manual describes a much more complicated procedure, for unknown reasons.

To change line alignment, you place the cursor on any blank space in the line on which you want realignment to begin, and enter Break-6. A three-option menu comes up, giving you a choice of flush left, flush right, or centered text. Note that "flush right" is not right justification, i.e. the padding of text with extra spaces to fill the lines. In any case, after you make your selection it is marked in the text by a nonprinting character, a green-and-black graphics block. All of the alignment commands are toggled and remain in effect until reset.

In *C.C. Writer*, embedded commands appear at the beginning of the first line to which they are relevant. They take the form of a slash (/) followed by a lower case letter and a number where appropriate. For example, /c centers the following line, /s4 skips four lines, and /p skips one line and starts a new paragraph (the indentation is set in the print format menu). There is limited control of line length: the /i command indents both margins by five spaces until cancelled by another /i. There is an implied hierarchy to the commands, but it rarely causes any problems.

Other Editing Functions

I have already described how the three programs go about deleting blocks of text. All three also have the ability to move pieces of text around, which is one of the great features of word processing. *Teletwriter* and *Scriptit* handle this job in similar ways: the beginning and end of the block are marked, and the move is then accomplished by designating the new location. *Teletwriter* uses Clear-B to mark the beginning, Clear-E for the end,

and Clear-C to copy the block to its new location. This is a copying operation, not simply a move, so the original block must still be deleted. *Scriptit* uses only one command, Break-9, to mark all three locations of interest for a move. If you want to copy a block of text, use Break- for the three commands.

With *C.C. Writer*, you must call up the Move command (disk version) or option (cassette version). You then use Line Seeker to move through the text to the beginning and end of the selected block, which you identify by entering B and E. Finally, you move to the sentence in front of which you want the material to be inserted, and enter T (for Target) to complete the move. There are no provisions for copying material.

All three programs have provisions for finding a specified character string and either changing it or not, at your option. In *Telewriter*, Clear-G allows you to specify both the character pattern to be found and its replacement. With the text screen on display, Clear-N causes the cursor to jump to the next occurrence of the search text; Clear-R causes a specific occurrence to be replaced. You can get pretty speedy at this by holding down the Clear key and alternating between N and R with two fingers of the left hand.

You can use this technique with a null entry as the replacement string to delete selected occurrences of a word or phrase.

Scriptit works in similar fashion, with Break-7 as the command for specifying the target and replacement strings. The Enter key steps you through the text from one occurrence to the next, and at each one you have the option of changing, leaving unaltered, or changing all subsequent occurrences of the target.

"...It's a word processor...we just made this 12 lever fudge torte from 6 volumes of the decline and fall of the Roman Empire..."

And *C.C. Writer*? Here you have the Global Edit command or option, which will prompt you for the traditional two strings. At every occurrence you can enter n to skip, or just use the enter key to make the replacement.

Print Formatting

Although embedded commands take care of incremental changes, all three word processors need separate format

Scriptit offers the option of recording files on tape in ASCII format, which means that it can be used to compose and edit Basic programs.

menus to set most of the parameters which govern the appearance of the printed page. The degree of control varies quite a bit between programs.

The format menu for *Telewriter* is the most elaborate, largely due to the provisions made for interfacing with the MX-80. It also affords the user an opportunity to change the baud rate for transmission from computer to printer; the default is 600 baud, but there are provisions for going as high as 4800. Of course, conventional print parameters such as side, top, and bottom margins; line length; and spacing can all be controlled.

A single-letter command is used to generate a flashing cursor next to the desired command; the default values are all displayed, so it is an easy matter to decide which ones you want to change. One which will almost certainly change is the number of characters per line. The default is 50 to match the width of the screen display, but 60 is a much more reasonable value for printing on 8 1/2 x 11 paper.

One useful feature is the ability to print only a portion of the material in the text buffer. This is especially useful for previewing a piece of text with a complicated format, for example. It just calls for a little coordination. First, the end of the desired text block is marked with Clear-E while in the Entry/Edit mode. The cursor is then moved back to the beginning of the block, and the Clear-M command is given to return to the main menu. Now the F command gets the format menu, and finally the % key performs the desired partial print. There is an analogous partial save com-

mand for recording part of the text buffer to tape.

As I shall discuss a little later, *Telewriter* supports chain printing—the stringing together of several text files from tape or disk to create a long document. The format menu controls this by asking for the number of files in the queue. This should be one less than the total number of files you plan to print, since the first one must be loaded into RAM before you start printing.

Color Scriptit employs a considerably shorter format menu, which it calls standards. It affords control over the basic size parameters, though, and includes a couple of special features: the option to print in all capitals and a hyphenation minimum. The former would seem to be a real curiosity, until you consider that *Scriptit* offers the option of recording files on tape in ASCII format, which means that it can be used to compose and edit Basic programs. The all capitals option must be used if such files are to be read properly by the Color Computer.

What about hyphenation? *Scriptit* can identify words which are candidates for hyphenation, so that their first halves can be moved up to help fill out a short text line. This can improve the appearance of a printed document. To invoke hyphenation from the Edit mode, use the command Break-8. The cursor will move to the first word that can be hyphenated, although it may not stop at the first letter of a syllable. Move it back with the left arrow key until it is so positioned, and press Break-0. The letters to the left of the cursor will shift up to the end of the previous line, followed by a hyphen. Normally, the program will identify words that can be hyphenated if at least three characters fit on the previous line; this is the "hyphenated minimum" which can be changed on the standards menu.

Scriptit has one quirk which must be taken care of with this menu. The default for the number of print lines per page is 66, which is appropriate for an 11" page; however, if you plan to print a double-spaced document, you must change this to 33 to locate page numbers, headers, etc., properly. The two other programs can figure this out for themselves.

The format menu for *C.C. Writer* called Page Controls, is fairly elaborate. It includes options for pausing at every page break, ejecting the last page of a document, setting the paragraph indentation, and specifying a header to be printed on every page but the first (the other programs incorporate headers with the text). It is unique in that it also has a true right justification option. It can also be a little maddening, at least in the cassette version, because to change

one of the parameters you must review the entire menu twice.

You must step the cursor through every option even if you decide to change nothing; change one parameter, and you must review the whole list again. It increases your chances of getting the setup you want, I guess. Things are somewhat better with the disk version in which your personalized defaults are stored and called up for each document.

Handling Storage Media

The three programs vary in the degree of flexibility with which they interact with tape or disk. *Telewriter* and *C.C. Writer* allow you to chain files together during printing, while *Scriptit* relies on its larger buffer to hold anything you, might want to print. I have already mentioned that *Telewriter* requires the number of files in the tape queue to be specified; with *C.C. Writer*, you use an embedded command to specify the next file to be printed. The syntax is /d followed by the next filename, and this must be the last line in a file.

The inability of *Scriptit* to chain print can be a liability; the draft of this review

Telewriter and Scriptit share the ability to append a recorded file to whatever is in RAM.

comes close to filling its buffer, for instance. Of course, you can always print one file, manually position the tape and read the next file into memory, print that one, etc., but this is awkward. The text would be broken up with large white spaces, too, because *Scriptit* automatically advances to the top of the next page after finishing a printout.

Each program has a noteworthy media-handling feature or two. I have already mentioned the *Telewriter* Partial Save. Another particularly useful command is verify, which allows you to check the integrity of a recorded file before clearing RAM for further work. This is of particular value when working with a 16K computer and cassette recorder; I have written things that required the chaining of more than 20 files, and you'd better believe that I was in no mood for an I/O ERROR message in the midst of a printing session.

Telewriter and *Scriptit* share the ability to append a recorded file to whatever is in RAM, assuming the two will fit. *Telewriter* even gives you a detailed message if the sum of the two files is too

large and tells you the amount of overflow. The main menu command for the append function is A; a special command is needed because a normal read destroys whatever was in the text buffer. The *Scriptit* read operation (Command 2 from the main menu) is nondestructive in this sense, so the same command can be used to append text.

The disk version of *C.C. Writer* has a very nice feature: single-keystroke commands to make a backup copy of whatever is in the text buffer. A B command from the main menu will cause the text to be written to a disk file called BACKUP/CCW. Entering an isolated lower case b from the Type (input) mode will do the same thing—very handy if you want to leave the keyboard for a few moments in the midst of a long session.

Some Opinions

In this review, I have tried to give you a feeling for what it is like to work with *Telewriter*, *Color Scriptit*, and *C.C. Writer*. Of course, almost every aspect of each of these programs has subtleties that I haven't discussed. There would be no point in my reproducing the instruction manuals, after all. What I would like to do, though, is share a few impressions I have gained through working with the three programs. These are highly subjective, but they may still be of interest to anyone contemplating the purchase of a Color Computer word processor.

I think that the strongest of *Telewriter's* features is the free-wheeling mode of operation which its full-screen editing promotes. My own writing style is rather loose and floppy; I skip back and forth to change the last paragraph, add to the current one, and so on. Somehow, *Telewriter* seems to fit my undisciplined style; switching between text entry and correction modes just slows me down.

The relatively high-density format helps, by making so much of the text visible at any time. All in all, I think *Telewriter* gives the user the best control over the appearance of the final printout, too, although I still regret the absence of a tab setting command.

Color Scriptit does almost everything I need, but a few things do get in the way. I have mentioned the lack of file chaining, which would never come up at all if I wrote shorter pieces; the inability to scroll back and forth by a page at a time; and the requirement to go into Insert mode to add text to the middle of a file.

To these I should add the use of re-defined number keys, rather than letters, for commands and menu selection. The simple fact is that there is no mnemonic relationship between Break-5 and the tab setting function; wouldn't Break-T

have been better? At the very least, Radio Shack should furnish a keyboard overlay with this package. The procedure for defining headers and top and bottom margins also seems more cumbersome than necessary.

What do I like about *Scriptit*? Well, I think the hyphenation function is neat, and so is the Print to Tape option which writes files in ASCII format. The con-

Together with other recently announced word processors, these three give Color Computer owners quite a reasonable choice.

cept of using a word processor to compose a Basic Program seemed a little strange to me at first, but the ability to find and change character strings has come in handy for renaming variables and for adjusting line numbers in the middle of a program. This dual-purpose operation might be an important consideration if you are really interested in keeping down the cost of your software library.

The ability of *Scriptit* to print text flush against the right margin is useful for special jobs such as return addresses on business letters, but it doesn't take the place of true justification. I think that the appearance of correspondence is much improved by straight left and right margins. This is the unique province of *C.C. Writer*, at least among the three programs discussed here.

The *C.C. Writer* justification routine is too slow to be useful for a long manuscript, though. This may be due in part to the program being written in Basic—another unique point. The advantage to this, of course, is that you could probably "customize" your own copy of *C.C. Writer* fairly easily.

The Bottom Line

Here's the bottom line: Each of these programs has its strengths, although differences in working styles could make for some real mismatches between writers and software in individual cases. Together with other recently announced word processors, these three give Color Computer owners quite a reasonable choice in applying their machines to professional and personal writing.

Try to think about your own needs and style of operation, and make allowances for future development of both when selecting one.

Epson HX-20 Computer

If you have picked up just about any computer magazine in the last six months you have probably seen the double page ad spread in which the Epson HX-20 is pictured full size. Indeed, the unit could almost have been pictured on a single page, since it measures just $8\frac{1}{2}'' \times 11\frac{3}{4}''$. Its height is a diminutive $1\frac{3}{4}''$.

But that's nothing new, you say. The Sinclair ZX80 is about one half the size of the HX-20 and it has been out for several years. True, but at the risk of offending scores of loyal Sinclair owners, let me observe that the Epson has a great deal more capacity and capability built in. I was tempted to say that the HX-20 is a "real computer," but that would have been a low blow, and incorrect too—the ZX80 and 81 are as real as any.

In addition to small size, the other main thing that sets the Epson apart from the field is built-in battery power for true portability.

While we cannot report definitively about reliability and support, we speculate that they are likely to be excellent, given the outstanding reputation of Epson in the printer market. For a "one of the pack" company three years ago to emerge as the dominant supplier of dot matrix printers worldwide indicates they are doing a lot of things right. Contributing to this success is undoubtedly some guidance from the Seiko parent company, but mainly an excellent management team in the U.S., Japan, and other countries.

Figure 1. Top view of HX-20. The computer is about the size of a piece of paper.

David H. Ahl

A Compact Portable

As mentioned above, the HX-20 is about the size of a three-ring binder and, at $3\frac{1}{2}$ pounds, not much heavier. It fits easily into an attache case or slipease. Unlike some portable videotape machines that require a battery which

weighs nearly as much as the machine itself, the HX-20 rechargeable battery is built-in and included in the $3\frac{1}{2}$ pounds. The nickel-cadmium batteries can keep the HX-20 running for 50 hours, yet need only eight hours to recharge. This is very impressive since most ni-cad battery run time to charge time ratios are just the opposite.

Most calculators today, even the least

Epson HX-20, continued...

expensive units, have an automatic shut off. For example, APF units shut off automatically if nothing has been pressed after seven minutes. The HX-20 lacks this feature which I found a bit surprising.

However, when the HX-20 is shut off, it continues to trickle a small amount of power through the all-CMOS memory, thus keeping intact all the contents in memory. As long as the unit is recharged from time to time, these programs and data will be stored indefinitely.

Full Stroke Keyboard

The keyboard of the HX-20 is in the standard QWERTY layout with a few extra keys on the right side. In particular, in addition to letters, numbers and the usual symbols, the HX-20 includes two kinds of brackets, four directional arrows, and five keys for providing instructions to the computer. These keys include home/clear, insert/delete, scroll up/down, number, and graph.

The number key is, in effect, a type of shift key which engages a numeric keypad using the keys, m,j,k,l,u,i,o,7,8, and 9. The graph key is also a type of shift key which produces block graphics and symbols from the keyboard.

Above the keyboard to the right are eight function keys. Three functions are built-in: pause, menu, and break. The five other function keys may be programmed by the user.

As its name implies, the pause key causes a running program to halt temporarily. Hitting any key causes it to resume.

The menu key brings up a menu on the screen. On the menu, Number 1 is always Monitor, 2 is Basic, and 3 through 7 are user-written programs. More about this later.

Break halts a running program and returns to Basic. The contents of memory are not altered upon pressing it.

The five programmable function keys

come from the factory with certain functions preset:

Key	Standard	Shifted
1	AUTO	Date/Time display
2	LIST	LOAD
3	LIST	SAVE
4	STAT	TITLE
5	RUN	LOGIN

Functions such as LIST and RUN execute the command when the key is pressed. Other commands such as LOAD and SAVE appear on the screen followed by a space and wait until the user fills in the rest of the command.

Recessed on the right side of the computer toward the rear is a reset switch. Pressing it interrupts the computer and calls up the initial menu. Also on the

right side is an off/on rocker switch.

Other external controls include two for the printer, an off/on slide switch and a paper feed button. A rotary view angle control on the left side actually changes the angle of the LCD elements of the viewscreen slightly to suit your operating position. You simply turn the knob until maximum contrast is achieved.

An Open Window

The display is a 20-character by 4-line liquid crystal display (LCD) unit. It is unlike a calculator in which each number is formed from a combination of seven line segments; instead, the screen consists of 120 x 32 pixels or dots. Characters are formed within a 5 x 7 dot matrix. This means, of course, that lower case letters do not have real descenders as they do on full screen video displays.

The screen is actually a "window" onto a much larger virtual screen. The size of the virtual screen can be defined by the user to be between 20 and 255 characters wide and 4 to 255 lines high. This does not mean that you can define a screen measuring 255 x 255, because that would require far more memory than is available in the HX-20.

The window may be moved horizontally and vertically with the arrow keys or, within programs, by using four Basic language commands: width, scroll, locate and locates. The locate command

Everybody's making money selling microcomputers. Somebody's going to make money servicing them.

New NRI Home Study Course Shows You How to Make Money Servicing, Repairing, and Programming Personal and Small Business Computers

Seems like every time you turn around, somebody comes along with a new computer for home or business use. And what's made it all possible is the amazing microprocessor, the tiny little chip that's a computer in itself.

Using this new technology, the industry is offering compact, affordable computers that handle things like payrolls, billing, inventory, and other jobs for businesses of every size...perform household functions including budgeting, environmental systems control, indexing recipes. And thousands of hobbyists are already owners, experimenting and developing their own programs.

Growing Demand for Computer Technicians

This is only one of the growth factors influencing the increasing opportunities for qualified computer technicians. The U.S. Department of Labor projects over a 100% increase in job openings for the decade through 1985. Most of them new jobs created by the expanding world of the computer.

Earn at Home in Your Spare Time

NRI can train you for this exciting, rewarding field. Train at home to service not only microcomputers, but word processors and data terminals, too. Train you at your convenience, with clearly written "bite-size" lessons that you do evenings or weekends, without going to classes or quitting your present job.

Your training is built around the latest model of the world's most popular computer. It's the amazing TRS-80™ Model III, with capabilities and features to perform a host of personal and business functions. No other small computer has so much software available for it, no other is used and relied

on by so many people. And it's yours to keep for personal or business use.

You get plenty of practical experience. Using the NRI Discovery Lab* that also comes as part of your course, you build and study circuits ranging from the simplest to the most advanced. You analyze and troubleshoot using the professional 4-function LCD digital multimeter you keep to use later in your work. Then you use the lab and meter to actually access the interior of your computer...build special circuits and write programs to control them. You "see" your computer at work and demonstrate its power.

Computer Assisted Instruction

Your TRS-80 even helps train you. You receive 4 special lesson tapes in BASIC computer language. Using them in your microcomputer, you "talk" to it as you progress. Errors are explained, graphics and animation drive home key points. Within a matter of minutes, you'll be able to write simple programs yourself.

Become the Complete Computer Person

In addition to training in BASIC and advanced machine language, you gain hands-on experi-

ence in the operation and application of computers to business and personal jobs. You're trained to become the fully rounded, new breed of technician who can interface with the operational, programming and service facets of today's computers. You're ready to take your place in the new electronic age.

Other Opportunities

NRI has been giving ambitious people new electronic skills since 1914. Today's offerings also include TV/Audio/Video Systems servicing with training on our exclusive Heath/Zenith computer-programmable 25" diagonal color TV...Industrial Electronics, Design Technology...and other state-of-the-art courses.

moves the cursor anyplace on the screen and automatically displays that portion of the screen in the display window. Locates allows you to display any desired portion of the virtual screen in the LCD display window.

Although the text is formed of pixels, Epson has chosen to offer two independent display modes, text and dot-addressable graphics. On the HX-20 LCD display, the two display modes may be superimposed on each other; this is not possible on an external monitor or TV set.

As delivered, the HX-20 does not drive a monitor or TV set; an extra module, which was not available at the time of this evaluation, is necessary. The specifications I was given for the display dimensions on a monitor or TV set sound a bit strange—32 characters by 6 lines. The graphics display was quoted as 128 x 96 pixels in monochrome or 128 x 64 in four colors.

Our friends at *Personal Computer World* in England tell us that if you use color, a bizarre addressing mode, in which there are 64 physical pixels vertically but 96 addresses, prevails. Hence, either 0.0 or 0.1 will light the pixel at 0.0, but only 0.2 will light 0.2 and so on, alternately. That could lead to some "interesting" effects.

Dual Processors

The HX-20 represents a sharp departure from conventional microcomputer architecture. It uses two 6301 (hub?) microprocessors, designed and manufactured by Epson. They are supposedly compatible with the Motorola 6800. Other computers with multiple MPUs usually use one for processing and memory control and the other for I/O and display functions. In contrast, the MPUs in the HX-20 are in some way more of a master/slave relationship.

The master MPU does the processing

and also controls the memory, keyboard, display, clock, and barcode reader using external ROM while the slave MPU controls the printer, cassette recorder, RS-232 and high-speed serial ports, and the trickle power function when the unit is turned off. For these functions, the slave uses 4K of ROM which is on the MPU itself. Also on each MPU are 128 bytes of RAM. The two MPUs communicate with each other by means of a 38,400 baud serial link rather than the parallel link that one might expect.

The HX-20 is delivered with 16K of RAM which is optionally expandable to 32K with an external module. We expected that a compact unit like the HX-20 might use 64K memory chips. It does not; the built-in 16K is in the form of eight 16K bit chips. However, the 32K of ROM which contains the monitor, Basic language, and the like is found on four 64K bit chips. There is also a spare socket for 8K of expansion ROM.

The screen is actually a "window" onto a much larger virtual screen.

Built-in Printer

On the top left of the HX-20 a small adding machine type printer is found. It uses rolls of plain paper 2 1/4" wide. It appears that standard adding machine tape can be used in the printer. The ribbon cartridge looks like a miniature version of the one in the MX-80 printer and is unexpectedly easy to replace.

Up to 24 characters can be printed on one line, 1.85" in length. The characters appear smaller than those produced on other printers, but are equivalent to 9-point type (the same as the type in this

article). In fact, the MX-80 also produces 9-point type. The difference is in horizontal spacing of characters; the MX-80 and other similar printers print 10 characters per inch while the HX-20 packs 13 characters per inch.

For printing of graphics, this closer spacing leads to a crisper image than that produced by many dot matrix printers. Built into the firmware is a simple routine to get a screen print. Also, as mentioned above, LIST is function key 3.

Printing speed is roughly 17 characters per second or 42 lines per minute. The printer sounds like a swarm of angry hornets being driven from their nest. The MX-80 sounds like a church mouse by comparison.

The HX-20 can drive an external printer, however, at the time of this test we did not have an interface cable or the documentation to build one.

Beeps and Boops

Behind a 1/2" x 2" rectangle of holes under the LCD display is hidden a speaker. Well, not exactly. It is a piezo-electric device which can be programmed to beep and boop at different pitches and durations.

Within Basic is a command, SOUND p,d: The parameter p corresponds to pitch (four-octave range); while the parameter d corresponds to duration in tenths of seconds.

External Devices

Two external devices have already been mentioned, a printer and a monitor or TV. To connect to these and other devices, the HX-20 has two DIN connectors on the back. An 8-pin socket is for RS-232C devices such as terminals, printers, modems, and even other computers. It communicates at speeds up to 4800 baud.

A second 5-pin DIN socket has a maximum transfer rate of 38,400 baud for communicating to disk drives or, with an adapter, to a monitor or TV set.

On the right side are four mini sockets, three of which hook up to an ex-

ternal cassette recorder. One socket is for input, one for output, and the third for motor control. The fourth mini socket is for a barcode reader.

On the left side is a flat connector normally covered by a piece of black plastic. This is a parallel connector for a 16K expansion RAM memory module.

An optional device which, if installed, occupies the top right of the case is a microcassette recorder. This same space can also be occupied by optional ROM software modules. The microcassette recorder is a digital unit, not audio, although it uses standard microcassettes. It reads and writes at a speedy 1300 baud and can store about 50K bytes of data or programs on a 30-minute cassette. This is equivalent to about 40 double-spaced typewritten pages. A nice feature is an accurate tape counter which allows fast winding to a program or area of data before loading. This is not a manual counter as found on other

recorders, but is in software. Very neat!

The only other external device is a 6-volt power supply that plugs into the back of the HX-20. This is normally used for recharging and not for computer operation, although it can be if the batteries are low and you simply must use the unit.

Basic Language

Epson Basic, called EBasic appropriately enough, is similar to Microsoft Basic, but was written by Ski Soft, Inc. of Cambridge, MA.

To enter Basic, you simply select Option 2 from the menu. Almost like a mini-timesharing system, the HX-20 gives you a choice of five program areas. If you do nothing, you will automatically be in P1 (Program Area 1). To get into another area or program, you use the LOGIN command. If you want your program to be added to the menu list, you simply give it a TITLE and it will automatically become the next one on the list.

Once a program has a title and is on the menu list, it cannot be written over. Even giving the command NEW will not

**The printer sounds like
a swarm of angry
hornets being driven
from their nest.**

erase it. This is a very valuable protection device. Actually, it took me some time to find out how to get rid of a program; a null title seems to be the answer, i.e., TITLE "".

Good editing functions such as automatic line numbering starting wherever you wish, line renumbering, delete, and non-destructive cursor movement are provided. Basic also provides a STAT command for getting the statistics on all the programs in the machine (title, size, available memory).

The pause has a second very useful function when writing programs. In particular, it can be pressed while a program is listing. Remember, you see only four or fewer lines on the display. By pressing a number after pause you automatically set a scroll speed from very slow (9) to very zippy (1).

To debug a running program, EBasic incorporates a trace mode. The command TRON turns on the trace mode. What this does is show on the display the line number of each new line as it is executed. Trace can be turned on and off from the keyboard or from statements embedded in the program.

Figure 7. Program to make the HX-20 into an expensive digital clock; the date and time are displayed in the center of the screen. The program "beeps" as each new second is displayed.

Basic has the usual numeric and string variables. Variable names may be up to 16 characters long and must begin with a letter. Certain words that mean something in Basic are reserved and may not appear in a variable name. For example, NOTE is an illegal name because it begins with the reserved word NOT. There are 137 reserved words.

Commands may be issued in either upper or lower case; the HX-20 is case insensitive in this case (groan). Thus, although output statements (PRINT, LPRINT) will preserve upper and lower case, the Basic language itself doesn't care. To it, the variable names MAX, Max, and max are all the same.

Under the default conditions, the HX-20 allows for up to 200 characters in the string variable workspace. If this is not enough for a given program, the string space can be enlarged by the command CLEAR. For example CLEAR 1000 clears out an area which can store up to 1000 characters. However, a large string space does not mean that you can have one string that is 1000 characters long; the maximum length of one string variable is 255 characters.

EBasic has a rich library of 38 numeric and 13 string functions. The expected math and trig functions are present as well as many graphics and numeric conversion functions. The early copy of the manual with our HX-20 did not have all the functions fully defined or explained; some of them looked most unusual.

Three interesting functions are DAY, DATE\$, and TIME\$. Since low power is continuously applied to the memory of the HX-20, why not put in a piece of quartz and let the computer tell the day, date, and time (particularly if your parent company is Seiko)? That is what the designers did, hence, once entered, these

IT'S JUST GREAT

NO. 1 IN THE SERIES

THE CUSTOM APPLE & Other Mysteries.

**CREATE A WHOLE NEW WORLD OF POSSIBILITIES
FOR YOU AND YOUR APPLE.**

Dateline: California, January 1983.

J.R. Programmer, bit diddler and hardware hacker extraordinaire, wished that his APPLE computer had 6522 I/O capabilities available.

To have that one enhancement would open new vistas in data acquisition and display, complete his project, and make him millions.

"Gosh, wouldn't it be nifty?" exclaimed J.R.

But alas, the lack of appropriate hardware prevented him from accomplishing his goal.

J.R. looked everywhere in his local computer store for an interface or expansion board to solve his dilemma, but none were designed for the magnificent project he had in mind.

"Shucks . . ." he stormed, "what am I to do?"

Poor J.R.

But then, just as he was about to give up all hope, a splash of color caught his eye over in the book section . . .

The Custom APPLE & Other Mysteries.

"Oh joy, Oh joy!" cried our hero.

"This book gives me the information, specifications and references I need to do the

hardware enhancements, whether I am a beginner or an expert, and provides me with the basic information required to write the software, common to many of the projects, myself. This book is just crammed with all kinds of neat stuff!"

J.R. left the store, also an LJG book dealer, a very happy man.

A Hardware and Software Modification Guide.

The Custom APPLE & Other Mysteries provided J.R. with a number of data acquisition and control projects with camera ready printed circuit layouts like the 6522 application interface board, an 8-Bit D/A and A/D converter, a sound and noise generator board, an EPROM burner board, an APPLE Slot Repeater, and included information on the APPLE as a square wave generator, the control of two stepper motors, connecting two 6502 systems, and lots lots more.

Plug-In To Power And Get Turned On!

The Custom APPLE & Other Mysteries is available for \$24.95 at computer stores, B. Dalton Booksellers and independent book dealers around the world. If your dealer is out of stock, order direct from LJG.

Include \$4.00 for shipping and handling. Foreign residents add \$11.00 plus purchase price. U.S. funds only please.

values are available in programs.

As with the functions, the expected numeric operators are all present. Boolean operators are also available, including the seldom seen implication (IMP) and equivalence (EQV) in addition to the more common AND, OR, NOT, and XOR.

The HX-20 has no calculator mode built in, per se. However, Basic has an immediate mode so that entering a command such as `PRINT 3.25/.005+2.4` will cause the calculations to be performed and the answer to be displayed. Furthermore `PRINT` can be typed as a question mark to minimize keystrokes.

The HX-20 can perform calculations in both single- and double-precision (16 digits) accuracy. Variables and data can be decimal, hex, and octal(1) integers.

All the usual, expected statements and commands are in EBasic along with a few notable additions. In particular, an `INPUT$` statement is included; it reads a specific number of characters from the keyboard or a file and waits until they are all delivered before proceeding.

Again, the file handling statements

All the usual, expected statements and commands are in EBasic along with a few notable additions.

are pretty much as one would expect, but with a few interesting additions. The function `LOF` returns the length of an open file in bytes. Each file is defined in the form "Device name: file name" with file name being optional. As on DEC's RSTS-11 (Resource Sharing, Time Sharing) system, a file can be easily directed to another device by simply changing the name. Recognized devices include the keyboard, display, internal and external cassette recorders, RS-232 ports, and internal printer. We are told that the ROM software packs will be recognized also.

Files may be saved in either ASCII or a compressed binary format. The files mentioned above (tape, printer, display, etc.) are all sequential files. However, files in the RAM memory are random

access. In addition to allocating string space, the `CLEAR` command can be used to set aside protected file space. Once allocated, individual files can be defined in this cleared area using `DEFILL` which defines record length and number of bytes from the beginning of the first record. All types of data may be mixed in a record.

It would seem that RAM memory files would be quite useful for storing tables of constants or conversion factors that must be frequently referenced or for storing data to be passed from one program to another. This sort of capability encourages structured programming since intermediate results are easily set aside for use in the next set of steps.

The graphics commands are adequate if not extensive. `PSET` lights up one pixel, `PRESET` turns it off, and `LINE` draws a line between two defined points. `POINT` is a cousin of `PEEK` in that it tells if a particular pixel is lit up.

In summary, EBasic is sophisticated and well suited to the capabilities of the HX-20. We expressed disappointment in the Basic implementation for the DEC Rainbow 100 in that it did not take full advantage of the hardware; this Basic is quite the opposite. As would be expected, the Basic tends to be oriented most strongly toward business, engineering, and educational applications. Graphics games enthusiasts should look elsewhere.

Monitor and Machine Language

When you switch on the HX-20, the screen always shows the menu, the first three lines of which are always the same, namely:

```
CTRL/@ Initialize
1 MONITOR
2 BASIC
```

The first line essentially says that pressing the control and ampersand keys together will initialize the computer. This clears all memory contents and the system clock. It also sets default values for memory size, and file space, and re-assigns the five function keys to the ten preset functions described above. Thus `control/@` is a global and somewhat dangerous command.

According to the rather sparse documentation we had, more of which later, the monitor is interrelated with "assembly language" programming. Unfortunately the documentation provided no instructions whatsoever for writing machine or assembly language programs. The closest we came to doing anything in assembly language was to use the `MEMSET` command to allocate space for programs below the space for Basic programs.

If the processor is truly compatible with the 6800, then one could presum-

ably use one of the many books on 6800 programming to write code for the HX-20. I am not sufficiently versed in 6800 programming, or any machine language programming for that matter, to experiment with this.

The monitor commands allow dumping and changing blocks of memory and saving binary files on tape. The monitor also gives you the ability to change the contents of the various processor registers and set breakpoints. One nifty command is *x* which allows you to set up a "boot" program which is automatically executed when the HX-20 is switched on. Hence, you could have the machine come up in Basic, a word processing program, or anything else you wanted.

With the standard 16K memory, the amount of memory normally allocated to Basic programs is 12,891 bytes; another 500 bytes are allocated to variable and string file space; the balance is used by the system. Adding the 16K expansion memory pack increases the available program space to 29,275 bytes.

Other Software Packages

At the time of our evaluation, none of the other software packages was available. But at a recent conference, the Epson people were showing a pre-release version of a word processing package called Correspondent and mailing list program, MList. Both are to be made available "soon" on ROM packs.

Other software packages in the works include a spreadsheet program, Epsoncalc; a database management package called Personal Office, and a sales order package which lets orders be recorded, issues receipts, and downloads order files to a host computer at the home office.

Also in the works is a program writer type of package, DIY, along the lines of *The Last One* which is said to allow users to write software in plain English. We are somewhat skeptical about these type of packages, but this one could turn out to be better.

Documentation

At a recent conference, I held up the HX-20 in one hand and two fat three-ring binders of documentation in the other. I remarked that this is the first computer for which the documentation was larger and weighed more than the computer itself. Actually, that is not quite fair as the documentation I had was preliminary, double spaced and reproduced on only one side of the sheet. Presumably, when it is typeset and printed it will be considerably more compact.

I had only the documentation for the Basic language which, as mentioned ear-

lier, was produced by Ski Soft. The manual was an excellent combination of tutorial and reference material. Epson has a well-deserved reputation for user-friendly documentation, and this was no exception. Unfortunately, the manual lacked an index, a curious omission.

Unfortunately, several letters and six phone calls to the Epson folks in California failed to elicit a copy of the technical manual. Dick Pountain at *PCW* wangled a copy from the British distributor and he reports that it, like the Basic manual, is quite good.

Dick reports that "the technical manual is remarkably detailed, going

This is the first computer for which the documentation is larger and weighs more than the computer itself.

through all the hardware down to the signal and timing level and ending with maintenance and repair instructions which are intended for the dealer and repair shop."

In Summary

The HX-20 is a quantum leap forward in putting the power and capability of a full computer in a compact package. It is aimed squarely at business and educational users, both those willing to do their own programming as well as those seeking a turnkey machine. The planned software releases on ROM pack will enhance the usefulness of the machine substantially.

Personally, I believe the version that will have the widest acceptance is the one with the built-in microcassette recorder. Although using an external tape cassette recorder saves a few dollars on the purchase price, it reduces portability and does not permit the use of the excellent fast wind and seek capabilities. For many purposes, the built-in microcassette will obviate the need for a floppy disk drive (not expected out until

well into 1983).

The quality of the full-stroke keyboard is excellent, although because it is actually part of a printed circuit board, there is a noticeable "give" during fast typing. Strengthening or supporting this board would be a welcome modification. Nevertheless, it is certainly suitable for light word processing and I look forward to the introduction of the ROM pack.

For working on a plane, train, or away from the office the HX-20 is unrivaled. How often I have dreamed of having a spreadsheet or word processing computer with me on cross country or transatlantic plane trips! It would seem that the HX-20 is the answer to these dreams.

The barcode reader is an interesting add-on that could open up a huge market for stock control and sales order applications.

Given the immense marketing clout of the Epson organization, I expect the HX-20 to occupy a significant place in the computer market before too long. This suggests that many third party vendors will rush in to produce software packages which should contribute to the desirability and acceptance of the computer.

The Apple IIe Personal Computer

A First Hand Examination

It was a November week of visits to computer and other high-tech companies in California's Silicon Valley, a rich territory noteworthy enough to qualify for recent *Sixty Minutes* and *National Geographic* treatments. Highway 101 is the standard bus that connects the sprawling communities around San Jose, where the electronics industry knows little of recession. In fact, practically every office or factory visited fell into one of two categories. Either they had just moved into larger facilities, or expansion into a new building or wing was underway.

Veil of Secrecy

My job for the morning of the twelfth was to see firsthand one of the best kept secrets of the computer industry: the specifications and features of a machine that would have the onerous responsibility of becoming the successor to the world famous Apple II Plus. All I knew about it was its name: Apple IIe.

Directions I was given over the phone led me to a seven story Cupertino office building still undergoing final construction and outfitting for its first round of tenants. Fortunately, the directions also included the floor on which the meeting was to occur, because the sparsely-filled

Danny Goodman

building directory did not list Apple Computer, nor anything else on that floor. "What better way to keep a secret than to have offices on an unlisted floor," I muttered to myself.

When the elevator door opened, however, I was unmistakably in the lobby of an Apple Computer facility. Literature

and retail displays boasting the merits of the Apple II Plus and Apple III added color to the predominantly grey color scheme.

Our meeting was delayed a few minutes at the bidding of a Murphy's Law application ("If anything can possibly go wrong, it will."). The room in which the new computer and its predecessor had been set up and checked out the night

before suddenly had no power at all. Such are the mysteries of working in a new facility. Critics of the dependence of a company or professional on a computer should note this incident and conclude that we are instead dependent on more fundamental needs. Electricity, for example.

Before long, I met Paul Dali, general manager of Apple's Personal Computer Systems Division. Together we entered a small meeting room with what at first looked like two Apple II Plus systems—both with tops removed—set up along the windows. But no, the two machines were decidedly different.

Apple II Facts and Figures

As background to the development of the new model, Paul analyzed the success of the Apple II. He noted that over the years Apple has been pursuing five distinct markets with the Apple II. First is the office, where a computer is used as a productivity tool in basic tasks such as word processing, database management, communications, and the like. Such productivity applications represent Apple's biggest market.

Related to the office is the very small business market, a difference denoted not necessarily by company size (although generally with sales under \$20 million) but by specific applications for the business—vertical systems, Apple

calls them. Into this category fall uses such as accounting, payroll, credit union systems, and banking systems. He estimated that today there are about 250,000 Apple IIs in the office, and that most of these were brought into the office initially by an individual who spent his or her own money on the unit.

A third market—and still quite a large one at that—is the educational one. Twenty-five percent of Apple's sales are to the educational market—I would never have guessed such a large figure. The balance of Apple IIs go to the scientific/industrial and family/consumer markets.

Addressing so many and such diverse markets should be a nightmare for any kind of product. But the Apple II has a built-in feature that lets it meet needs in all these areas: expansion slots. The unit is an open system that lets the user put in anything that transforms the basic machine into a special purpose computer. Paul summarized the Apple II this way, "Flexibility is and always will be the single biggest reason why the machine sells. It is so adaptable."

An outgrowth of the flexibility of the II has been an enormous following of software developers. Apple counts well over 10,000 programs available for the II. Paul maintained that the installed base of the II is so big that it represents a market too big for programmers to overlook. "We can't stop the software development momentum. Every time someone writes more software, they'll tend to write for the Apple also."

Although the Apple II has gone through some revisions during its lifetime (replacing 4K RAM chips with 16K chips, improving color graphics,

and meeting FCC radio frequency requirements), the basic features have remained essentially unchanged. The mother board has seven expansion slots. The display output is a 40-column width format and characters are shown in upper case only. Finally, the Apple II has exhibited a good reliability record, according to an informal and totally unscientific dealer poll I have taken over the years.

Paul was quick to point out that despite its popularity, the Apple II Plus has several disadvantages. Lower case

A number of significant changes were made in the manufacturing process of the IIe as well.

letter display is not standard. On-board memory (RAM) is limited to 48K. The teletype-like keyboard has a limited character set. The attachment of peripherals (printers, modems, game controllers, etc.) requires removing the top and plugging onto the appropriate circuit card. An 80-column display (particularly useful in professional applications) is a costly add-on. And, although some of these deficiencies could be corrected with add-ons, not all cards were compatible with one another.

(At this juncture, Paul and I were joined by Walt Broedner, who designed the insides of the new Apple, and Rick

Rice, production coordinator. Walt brought along a chip-filled circuit board, and Rick had a complete computer as props for their parts of the presentation. More about those later.)

Enter Apple IIe

Paul then went on to formally introduce the newest Apple, the Apple IIe, "e" for "enhanced." And enhanced it is. While the changes in the IIe will be more apparent to current Apple followers, the end product for the first-time shopper is a machine with many built-in features.

To the uncritical eye, the IIe cabinet looks like a clone of the II. The differences in appearance lie in the keyboard (see below) and the logo. The proper designation is Apple II/e (as in Apple ///), and the logo is now at the lower left corner of the removable top instead of at the bottom center.

The basic ("vanilla," Paul called it) IIe will be sold with a minimum of 64K RAM, expandable to 128K with an additional memory board. That's getting the IIe up to where the Apple III starts taking over for heavy-duty business applications.

Applesoft Basic is no longer on a separate language board that takes up an expansion slot. It is now resident on the motherboard as part of a new custom integrated circuit.

Upper and lower case characters are both standard. Display characters on the monitor are composed in a 5x7 picture element array within a 7x9 field, allowing for lower case descenders.

The 63-key keyboard in many ways resembles that of the Apple III (without numeric keypad). The full 128-character

The speed and power of an IBM PC on a \$345 Apple® card.

FAST 5 MHZ OPERATION, TRUE MULTIPROCESSING

ALF's AD8088 Processor Card adds a fast 16-bit 8088, the processor used in the IBM PC, to your Apple II. It runs programs from its on-board memory at a full 5 MHz—12% faster than the IBM PC—while the Apple also runs at full speed. And two or more AD8088's can be used in one Apple, to tackle problems that are beyond many mainframe systems.

CP/M-86 AND 192K MEMORY

CP/M-86®, the 8088 version of the industry standard CP/M operating system, is available for the AD8088 for only \$200. AD8088 CP/M-86 uses the popular Microsoft Softcard® disk format so you can buy the latest programs direct from major software distributors like Lifeboat Associates.

CP/M-86 uses only 18K, leaving 46K for programs on a 64K Apple—easily enough memory to assemble 12K of object code. For large programs, our \$370 AD128K Memory Card provides 110K

program space, or 174K program space (192K system memory) for an extra \$75.

THE 8087 NUMERIC DATA PROCESSOR

The AD128K Memory Card features a socket for the Intel 8087 Numeric Data Processor. The 8087's 80-bit internal format gives 18 digits of accuracy (Applesoft has only 9). Its speed is equally impressive: it multiplies two 80-bit floating-point numbers faster than the Apple runs 10 machine codes!

FASTER APPLESOFT FOR SCIENTIFIC & ANALYTICAL PROGRAMS

Any program can be rewritten for fast operation with the 8088, but ALF's "FTL" program speeds up math in your existing Applesoft programs—without modification. FTL is activated simply by typing RUN FTL. Programs produced by TASC® or Expediter II® also run faster. The graphs below show the dramatic improvement with FTL.

RELIABLE LOW POWER OPERATION

The clean design of the "AD" series separates the two main components—processor and expansion memory, when needed—on two cards. Low-power components are used for cooler operation: each card draws less than an Apple ROM card—far less than a typical 80-column card.

Apple IIe Keyboard

ASCII set is on the keyboard. All keys also have auto repeat (holding a key down causes the character to repeat—especially helpful in fast cursor movement). The key layout of the IIe includes four cursor keys (all in a row at the lower right) and Open Apple/Solid Apple limited function keys (on each side of the space bar). A raised dot on the D, K, and one cursor key help touch typists keep on track.

The RESET key has been moved to the far upper right of the keyboard and an accidental press won't clear out your machine and an hour's keyboard input. That operation now requires a deliberate, three-key sequence (simultaneously pressing CTRL-OPEN APPLE-RESET). The new reset procedure is also aimed at saving the power switch, one of the biggest service problems on the II Plus.

The motherboard, although still presenting a 40-column display as standard, is equipped to accept a new, "inexpensive" 80-column card that has only five integrated circuits. No price for the

card was available, but it was to compare favorably with II Plus 80-column cards which cost in excess of \$300. The Apple 80-column card fits into an auxiliary connector located out of the way from the seven slots, but is still equiv-

alent to slot 3. The decision to offer 80 columns as an option was based on cost-conscious education and consumer market needs for only 40-column displays. With the IIe 80-column board in place, the user has mixed screen modes available. There can be graphics on the upper

screen and either 40- or 80-column text on the bottom four lines.

Low resolution color graphics are 40x48 elements in 16 colors. With 64K RAM installed, optimum color graphics resolution is 290x192 (six colors). But this increases to a 560x192 array if the full complement of 128K RAM is installed.

There are significant improvements in the back panel, or "backplane," as it is known. The panel is now metal, with several holes precut to accept female connectors attached by cable to the accessory cards installed in the expansion slots. There is room for up to four each of the following D-connectors: 25, 19, and 9-pin. The 9-pin holes also accept DIN-type connectors, popular in Europe.

Additionally, the game controller connector has been permanently installed on the backplane, yet the old connector has been left inside the cabinet (a small clock card was installed in the IIe for our demonstration). The use of panel connectors will make switching peripherals a much easier task. Incidentally, the design better seals the unit against RF leakage. All Apple-manufactured cards will have connectors and short cables, as well as an adapter that will let II Plus owners slide the connector into their plastic backplane slot.

Hidden Improvements

There are many changes, too, that may not be apparent to the user, but are no less important.

The microprocessor is a newer version of the older 8-bit 6502. The chip is called the 6502A which can operate at a speed of 2 megahertz (mHz.), but in the IIe is kept at the old speed of 1.8 mHz.

A number of significant changes were made in the manufacturing process of the IIe as well. In the Apple II Plus de-

THE BUS PROBE - Jade

Inexpensive S-100 Diagnostic Analyzer
So your computer won't fool you. And you don't have an oscilloscope. And you don't have a front panel. You're not alone - most computers have their occasional bad days. But without diagnostic equipment such as an oscilloscope (expensive) or a front panel (expensive!), it can be very difficult to pinpoint the problem. Even if you have an extender board with a superfast logic probe, you can't see more than one signal at a time. You're stuck, right?
Not anymore. Jade is proud to offer our cost-effective solution to the problems mentioned above. THE BUS PROBE.
Whether you're a hobbyist with a centerless kluge or a field technician with an anxious computer owner breathing down your neck, you'll find THE BUS PROBE speeds your repair time remarkably. Just plug in THE BUS PROBE and you'll be able to see all the IEEE-8010 signals in action. THE BUS PROBE allows you to see inputs, outputs, memory reads and writes, instruction fetches, DNA channels vector interrupts, 8 or 16 bit wide data transfers, plus the three bus voltages.
An on-board pulse generator can provide repetitive resets, interrupts or wait states, for trouble shooting.

sign, the circuit boards were installed in the cabinet of the unit at an early stage of production. Burn-in testing took up much manufacturing space because finished computers could be tested only in their cabinets. If a bad unit was discovered, the case could be damaged in the handling, causing costly reworking of the unit.

The IIe, however, is just one circuit board for most of its production life. All parts are now insertable by machine. Burn-in testing is done on the circuit board in specially designed racks. Rick Rise pointed out the edge connectors that send signals from the testing rack through the computers and a red LED that is designed into the board to indicate that everything is working properly. Now, just the circuit board need be

tested, in much less manufacturing space.

Goodbye, Mr. Chips

When looking at a II Plus and IIe side by side with their tops off, it is clear that a great deal of design energy went into reducing the number of integrated circuits for the IIe. For one thing, the designers have combined the old motherboard, separate keyboard circuit board, and Applesoft language card into a single motherboard. The 109 chips of the old system are now only 31. This 3-to-1 chip reduction is accomplished in several ways.

Solid state memory prices have dropped dramatically, opening the way for the inclusion of high capacity devices in place of many more lower capacity

chips. For example, all of the 64-kilobyte RAM of the IIe is contained on eight 64-kilobit dynamic RAM chips. The keyboard character set is housed in a single 32-kilobit ROM chip. For international sale, Rick pointed out on the Swedish Apple IIe he had brought into the room, the IIe has a 64-kilobit ROM which holds both the American English character set and a completely separate character set for the language of the country in which the computer is sold. The international user can choose which set to use.

(The IIe will be released simultaneously in Europe as it is here in the U.S., one of the first such products to perform this feat.)

But one of the biggest chip-saving efforts went into two custom ICs designed by Walt Broedner. The story behind their development deserves retelling.

Custom Effort

With a set of ideal properties for a new Apple in mind, Walt set out to design a new Apple about two years ago. After no small effort, Walt delivered his designs of two chips to Synertek (a semiconductor manufacturer) for the production of samples. Walt's designs used two 40-pin integrated circuits (like the 6502 microprocessor) instead of a single 64-pin pack, because Apple didn't have the experience of working with such packages in production.

Confidence with computers and the way they operate is as fundamental to a child's education as reading, writing, and arithmetic. Parents and teachers can build that confidence with well-designed software systems from Edu-Ware.

Packages like *Counting Bee*, *Spelling Bee and Reading Primer*, and the new *Spelling Bee Games* create comfortable interaction between children and the computer, making learning easy and fun.

EDU-WARE prepares them for their future.

One chip, called the Memory Management Unit (MMU), contains the Applesoft Basic language, 80/40-column support, the enabling ROMs, and keyboard reading circuitry. The other, the Input/Output Unit (IOU), acts as controller for the CRT display, cassette interface, and speaker. Getting properly functioning samples can take as long as a year. But because Walt kept both chips at a relatively small size (110 mils on a side, or 12,100 square mils, compared to a typical 64K RAM chip size of more than 30,000 square mils), and by using similar gate design in both, Synertek delivered two custom chips in December 1981, just 26 weeks after Walt handed them his design.

In his development, Walt used an emulator circuit board—the chip-filled board he had brought into the meeting—configured such that all he had to do was unplug two jumper cables, disabling 102 smaller chips he used as initial building blocks, and plug in the two custom chips to see if they worked. Both sample chips worked the first time!

Compatibility

The prime concern among potential customers, of course, is the compatibility of Apple II software, hardware, and firmware with the new Apple IIe. And how the hundreds of companies currently selling Apple supporting products will respond to the new unit.

From the outset, the design of the Apple IIe was built around making the new

machine as compatible as possible with II Plus. But Apple went one step further as we'll see.

Peripherals such as disk drives, monitors, printers, and modems are reported to be 100% compatible. Expansion slots

There is a single, 140-page spiral bound "Owner's Guide" that not only gets the user up and running, but is one of the best introductions to personal computing I have seen in a long while.

are completely compatible, because the same signals are at the same pin locations as on the old II Plus.

Software is largely compatible. The only difficulties would occur in a word processing software program, for example, that is not written to support an 80-column display. In that case, only the 40-column mode would be operable.

In tests of a lot of software, Apple engineers discovered that some software

utilizes copy protection schemes that look for very specific codes in memory locations throughout the machine. This way, if the program fails to receive the right codes, it "thinks" it is on a non-Apple machine that may be trying to copy the disk, and won't boot the disk. On the Apple IIe, those codes may not be in the same place as in the Apple II, so the disk would not be usable.

Another incompatibility problem will occur in accessory cards or firmware that play tricks on the Apple II to operate. For example, some cards require the removal of a chip from the Apple II motherboard. On the IIe, that chip may be incorporated in another, larger chip, making it impossible to disable its functions. Also, programs written in the monitor using entry points not recommended by Apple will have problems. Applesoft Basic programs, however, will be compatible.

To smooth the changeover from II to IIe in the software and hardware accessory ends, Apple has been actively engaged in notifying every vendor of Apple-compatible products they could unlearn about impending changes in the Apple. For more than six months, the company has been providing cooperating companies, on a non-disclosure basis, with an Apple IIe for software/hardware evaluation and development. (The in-house name for this effort was the Apple Seeding program, perhaps with apologies to Johnny Appleseed.) Those vendors who needed or wanted to

PRINTS LIKE A DAISY...COSTS LIKE A MATRIX.

Integral Data Systems introduces the only low-cost dot matrix printer on the market that features Maisey™ printing. Maisey printing is a technique that allows you to produce correspondence-quality text approaching that of more expensive daisy-wheel printers, but at much faster speeds.

How fast? With Microprism Printer's™ dual speed capability, you can output at 75cps in correspondence-quality and 110cps in high-speed data mode. And it also features sharp, high-density graphics in an 84 x 84 dpi format.

You'll get cleaner, crisper output than you ever thought possible in a single pass.

Other standard features of the Microprism include proportional

spacing, text justification and, of course, software compatibility with our more expensive Prism Printer™ line.

The Microprism Printer is the perfect system mate that can handle all of your printing requirements... it's the best of both worlds. So if you've been waiting for the price of daisy-wheel printers to come down, or the quality of dot matrix to go up, now is the time to check out the exciting new Microprism Printer from Integral Data Systems.

make changes have had time to make those changes and have software ready in time for the introduction of the machine.

Apple claims that most vendors welcomed the advance information. The companies were apparently pleased to learn that, although the IIe necessitated some changes or additional software offerings, their products would continue to enjoy a growing market with the new machine.

Apple itself will have two redesigned programs from its own software library to be introduced with the IIe. *Apple Writer* will support the 80-column display (when installed), as will a fast-sorting electronic database management program I saw, called *Quick File*. Both programs will also make use of the 128K, expanded RAM in systems so equipped (the 6502A, of course, can address only 64K RAM directly—the balance will be under software direction).

One Manual For All

Documentation supplied with the Apple IIe deserves special note. Gone, but available as options, are the "techy" Applesoft reference and DOS manuals

that have overwhelmed many a computer novice. Instead, there is a single, 140-page spiral bound "Owner's Guide" that not only gets the user up and running, but is one of the best introductions to personal computing I have seen in a long while.

Chapter One goes through the initial set up of the system. The next chapter is a guided tour of the system and instructions on loading a tutorial disk, called "Apple Presents Apple," supplied with the manual. Chapter Three presents an uncomplicated and cleverly illustrated explanation of how the Apple and disks work. Then a chapter devoted to DOS 3.3 (in which you learn that DOS and Basic require the CAPS LOCK key to be engaged), plus its most important commands and error messages.

Chapter Five discusses all the things you can do with your Apple from an application point of view (electronic word sheets, word processors, database management, telecommunications, graphics) along with suggested software and peripherals—some even from outside suppliers. There is no Basic language instruction here, but the manual discusses several languages to pursue on

your own with the help of other Apple manuals or software. Featured are Applesoft and Integer Basics, Pascal, Fortran, Logo, Pilot, and 6502 Assembly Language.

The balance of the manual covers other peripherals, troubleshooting tips (there is a limited self-test built into the IIe), books and magazines worth reading (of course *Creative Computing* is listed!), glossary, and index.

The last point in our discussion—and one in which I was particularly interested, having seen all this simplified power set up before me—was pricing.

Paul Dali returned to field this subject. Final pricing was not completed, but the cost of a basic 64K, 40-column Apple was planned to fall between \$1300-1400, or roughly the cost of the 48K Apple II Plus. The best bargains, Paul was quick to note, will be in packaged systems, just as they were for the Apple II. System packages featuring the old II Plus computer, one disk drive, a monochrome monitor and a software package or two for around \$2000 represented good consumer values. Such packages will exist for the IIe, with several "soft solutions" available by the end

Apple IIe, continued...

of 1983 depending on the markets the company is pursuing.

Impressions

That the new model sports the same case design and color as the veteran II Plus was no disappointment. Even after all these years, it is still a pleasing shape which I am not tired of seeing. And while a detachable keyboard would be a nicety, I fully understand maintaining a form factor that has such ready recognition with the Apple name.

The degree to which care had been applied to making the IIe as compatible as possible with its forerunner was a happy surprise. A company with the apparent marketing muscle of Apple could have tried to "brute force" its way into creating some new personal computer standard that would have been much less compatible.

A consumer benefit coming from the redesign of the motherboard is not the increased reliability coming from two-thirds fewer chips, but ability to assess all chips with the top off. This will speed service turnaround if one circuit should go bad.

The reduction in chip count also lightens the load of a power supply. The eight 64K dynamic RAMs in the IIe dissipate less power than all the 16K

RAMs in the II. In fact, in an early stage of design, the power supply (at first it will be the same as in the II Plus) was "looking" at a circuit that wasn't meeting even the minimum load requirements for a properly functioning II Plus. The supply had to be artificially loaded by converting some of the excess capacity to +5 volts available to peripheral cards. The net result is about one extra ampere of current available for the seven slots to share. Moreover, the 6502A, running at less than optimum speed, does so, only cooler. All this leads to a cooler running computer, likely to be even more reliable than the II.

Apple has been testing working models for about a year. Reliability studies, Walt Broedner claims, have shown the IIe to be more reliable than the II. The units have survived operation in temperatures below 0° Celsius and over 90° Celsius.

The biggest disappointment came at the discussion of price, especially after hearing how efficiently the unit could be manufactured and tested. I didn't expect the IIe to wallow around in the under-\$300 mud with the popular home computers, but I did expect, or hope to see the IIe come in at around \$700-800, even for just 48K RAM. So the standalone price of \$1300-1400 for a

64K unit seemed terribly high to me.

That's the benefit of making a computer with over 10,000 applications on the shelf. Serious computer shoppers are looking for solutions. If the software solution exists, and it happens to run only on an Apple, then Apple it will be, even if it is more expensive than other, comparably equipped machines.

The advance planning with outside software and hardware vendors was equally encouraging. The company appears to want everything 100% right before it unleashes its new offspring. That Apple was ramping up production and had a finished, printed Owner's Manual more than two months prior to formal announcement augurs well for a consumer-painless introduction of a product that will be in high demand and expected to work the first time.

Strip away the price factor, and you are left with a near perfect computer with enough power to take most personal computer users up to moderately sophisticated applications. The IIe is everything the Apple II Plus should have been a year or two ago, when it underwent development. Emerging, therefore, as it does in these turbulent times in the industry, the Apple IIe is a remarkably evolutionary personal computer. □

Getting Serious With The Color Computer

The TRS-80 Color Computer has been a part of my life for over a year. I started a project to write a book, and after spending a few long hours in front of the typewriter, I realized a word processor for my computer would be nice.

One of the necessary accessories would be a disk drive. Cassette program files have their place, but for a project as large as text files, a disk system is indispensable.

The current choice is between Radio Shack's disk system and the Exatron disk operating system. I chose the Radio Shack system for two reasons: it should

***I felt only slightly
handicapped by having
to relinquish 2K for the
disk buffer.***

be compatible with future Tandy software releases, and the DOS is in ROM.

Tandy has provided an excellent operating system for the Basic programmer who doesn't want to learn to use a disk operating system. The 35-

John Steiner

track double density system is completely transparent to the programmer. No "system" or special DOS handling is required to operate the system. Even

though I am a novice programmer, I was able, using the Disk System manual, to write and use a Basic word processor.

Another advantage of the ROM-based DOS is that no space is taken either on the disk or in RAM for DOS. The only disk space not available for user files is track 17, the disk directory. Only 2K of overhead is required for disk buffers,

John Steiner, 508 4th Avenue N.W., Riverside, ND 58078.

THE INCREDIBLE JACK

a single fully
integrated program

- ☒ word processing
- ☒ calc analysis
- ☒ file management

\$129.⁰⁰

How good can a \$129 package be?

JACK is a single program that performs word processing, calc analysis, and file management in a fully integrated easy to use environment. JACK competes with integrated packages selling for \$495, \$695, and "under a \$1000". Why did we price JACK at \$129? Because we believe that everyone needs integrated software and we think we can sell ten copies of JACK to our competition's one.

Process words with ease.

For starters, JACK allows 1, 2 or 3 column on-screen editing - try that with another word processor. With JACK, what you see is what you get. There are no hidden formatting directives to confuse you. JACK lets you insert, delete, copy, set tabs and margins, do fill and right justification. All commands are menu driven so you always know what comes next. For serious word processing you will want an 80-column card (we recommend Videx) and a shift key wire mod - but JACK works with a 40 column screen, too.

Free form calc analysis.

JACK lets you embed calculated values right in the middle of your text. Calculation rules are spelled out in English using names of fields you create (like INVENTORY or PROFIT). Full IF THEN ELSE logic, + - * /, exponentiation, string matches, greater than, less than, AND, OR, and NOT operations let you specify very complex calculations. JACK allows up to 100 calculation rules. If you are doing large spreadsheet work, use a spreadsheet program (we recommend our Senior Analyst Package available exclusively from Apple Computer of course). But for the rest of your calc analysis, you'll find JACK a pleasure to use.

Manage files your way.

JACK supports 60 files on an Apple II floppy disk. A maximum of 1000 records can be stored in these files. Each record can have up to 100 fields ranging in size from 1 character to 1000 characters. JACK lets you sort and select these records by any arithmetic combination of fields. Best of all, you can use the word processing features of JACK to create and modify your file definitions and the calc rules to automatically calculate values.

Which way is up?

Since JACK provides all these features in a single program, you need no longer worry about where the up arrow key has gone when you switch from calc to word processing. Screen handling, backspacing, and file naming don't change with each new application. You need not bother about data interchange formats, file structuring techniques or the other nonsense that you have to go through to transfer information from one package to another. You also don't have to worry about whether your new word processor wants an 80 column card that your old calc package can't stand. In a single simple environment, JACK does it all.

requires Apple II with 64K
memory and 2 disk drives

Color Computer Disk, continued...

and this can be reduced using the FILES command.

As a result, you can have a disk operating system on a machine with only 16K of memory. Before upgrading my machine to 32K, I felt only slightly handicapped by having to relinquish the 2K for the disk buffer.

Disk user file capacity is 156,672 bytes, and a maximum of 68 files can reside on a single side, of a soft-sectored 5 1/4" disk. The files are catalogued in TRSDOS fashion, with an 8-byte file name and 3-byte extension.

The drive 0 package includes a single drive unit, a ROM disk controller pack, drive connecting cable, and an instruction/programming manual. Another drive can be added to the system if required, and an optional four-drive cable allows interfacing of up to four drive units. One requirement of the disk system is that your Color Computer have Extended Color Basic.

A single drive unit has been in operation on my Color Computer for about six months, and has operated almost flawlessly. The only problem I have noted concerns television interference. There is a notice included with the unit that warns of television interference when you are using the drive on an early model computer. My computer, serial number 337, certainly qualifies. I was, therefore, not surprised to notice interference on my home television when I used the drive. I have not noticed any interference on my monitor. Tandy offers to modify any computer that requires correction of the problem. I have never felt it was severe enough to have corrected. Besides, I couldn't bear to be without the computer for the few days that the modification would take.

Since the drive unit has gone out of warranty, I have had only a couple of minor problems. Occasionally the DOS would not initialize properly, and either the computer would be locked up or Basic would work but disk Basic commands would only bring a response of "SN ERROR." I traced the trouble to dirty contacts on the ROM pack where it plugs into the Color Computer, and used a pencil eraser to clean the contacts.

The only other problem I have had occurred when the drive unit would respond only with I/O errors. I tried LOAD, SAVE, and DIR, and all gave the same error message. Since the unit was out of warranty, and since I have had some experience with electronics, I used a Phillips screwdriver to remove the drive from its case.

The problem turned out to be quite simple. The drive belt had simply slipped off the flywheel. After reinstalling the belt, the drive again performed

flawlessly. I don't know why it slipped off, and it hasn't happened again in nearly two months.

First, The Bad News

As you can probably tell, I have no real complaints with the drive, however as with all equipment, there are a few things that I dislike. Included in this list are the following. Utilities seem to lack sophistication. As an example, BACK-UP requires a formatted disk, unlike Model I and III TRSDOS which formats during the backup process. BACK-UP also copies all bytes on a disk, whether it contains only one small file or a full disk. For disks with little information on them it is easier to load and re-save those files.

COPY will transfer files from one disk to another, but it requires at least two

It provides many features and capabilities that are unheard of on systems that cost twice as much.

drives. File access protection routines are lacking. There is no lock or password protection capacity. The only file protection is the write-protect tab.

Another feature I would like is autostart, or DO files. There is no way to provide a turnkey system as the drive is now equipped. Though variables cannot be transferred from one program to another easily, it is possible to load and run a program from inside another program. My last gripe is the lack of an ON ERROR GOTO statement.

The Good News

There, I got all my gripes off my chest; now for some good news. First, the cost. Though the \$599 price on the disk system itself seems high and is comparable to prices for other disk systems (e.g., Atari, Apple), total system price is very competitive. A TRS-80 Color Computer disk system with 32K, and a single drive can be purchased for under \$1200 from many suppliers. Compare that to Atari and Apple with the same capacity.

The user manual is written to the same high standards as the two Basic programming manuals. Even though I was completely unfamiliar with file handling on a disk system, I was able to learn as the manual took me step-by-step through sequential and direct access files. I found, to my surprise, that my cassette file programs were transferred to disk with little problem.

Listed below are two file command lines, the upper line creates a text file on cassette; the lower line does the same on disk.

```
1000 OPEN "I". # - 1.  
"MAILLIST"  
1000 OPEN "I". # 1.  
"MAILLIST"
```

As you can see, the only difference is in the buffer number. This buffer number specifies which file is to be used. To transfer cassette file programs to a sequential disk file, use the line editor to remove the minus signs in the disk statements. Up to 15 disk buffers can be open at the same time. These details are best left to the disk manual.

Another handy command you can use is POKE &HFF40.0. With this command, you can turn off the drive motor. Normally this is not required, as DOS does this for you. I wrote a simple program to transfer disk files to tape for tape backup purposes. One problem with it was that the drive continued to run during the tape write procedure. This is because opening a tape file causes program control to leave DOS and enter the cassette file write routine. DOS doesn't get a chance to shut off the drive. Never use this command while a file is still open. In other words, the command *must* be preceded by a CLOS command.

The manual includes several sample programs that can be used. The list includes a membership file, checkbook and budget programs among others.

A service manual is available for those hobbyists who are technically oriented. There is a wealth of practical material on preventive maintenance, as well as service and repair information. Maintenance is straightforward; however you run the risk of voiding the warranty should you open the drive unit during the warranty period.

For example, drive speed adjustment is easy. My drive has strobe bars on the flywheel. To adjust for proper speed, insert a disk and use DIR to start the motor turning. Use a small insulated handle screwdriver to adjust the motor speed control while viewing the strobe bars under a fluorescent light. When the row of bars marked 60 Hz looks stationary, the drive is adjusted properly.

When I compare the Color Computer with other home computer systems, I am impressed with the TRS-80 cost/feature ratio. It provides many features and capabilities that are unheard of on systems that cost twice as much. The Color Computer, coupled with the disk system is sure to make large inroads in the home computer market. I have found over the last year that the system is vastly underrated, and has far greater capacity than most people give it credit for.

Foolproof, Flexible Database Management

My search for a database management system (DBMS) began about three years ago when I realized that bringing personal computing into my day-to-day business life could make me more efficient and my business more profitable.

As sales representative for the eastern region of a major company selling paper products—a highly competitive business—my job entails a lot of customer record keeping: competition, con-

tracts, calls, customer facilities, and a myriad of other details.

After deciding on an Apple II because of the vast amount of software available for the machine, I studied most of the database management systems available and finally settled on the *Data Factory* from Micro Lab. I am not a pro-

grammer, and I don't want to be a computer expert. My use for a computer is straightforward: I want it to assist me in the performance of my job, make me more efficient, and help me serve my customers.

I have never regretted the choice of *Data Factory*. First, it is a truly friendly and virtually foolproof program that provides me with the power I need. Second, it was at that time, and still is, the most flexible DBMS available for a small computer. Third, when I signed my first licensing agreement, I found that I had bought people and support as well as software.

Data Factory has allowed me to design my own record-keeping system without becoming a programmer or learning what amounts to a new computer language. But it goes beyond that. *Data Factory* also allows me to manipulate the data in the base in several unique ways and to produce reports customized to my specific requirements. Finally, the sophisticated math package which is an integral part of *Data Factory* lets me massage the figures in ways that approach some of the well-known spreadsheet programs.

Extended Warranty

Data Factory is a single program which includes a first-year "extended warranty" against destruction of the program disk (you get two identical copies of the program disk which cannot be copied). The extended warranty provides for replacement of a damaged or destroyed disk any time in the first year and also provides you with any updated versions that might be issued. I started with Version 3 and recently received my

latest copy, Version 5.0, automatically under Micro-Lab's policy, which costs \$30 annually after the first year.

In addition, data files developed under older versions of *Data Factory* are still compatible with the newer versions, and can be accessed through Basic, which is not the case with some competitive products. The features in each new version are worth many times the cost of the warranty.

Data Factory can be used with a one-drive system, but it would be clumsy and slow, as is the case with most such programs. My two-drive 48K Apple system uses an IDS 560 printer which I chose for its high speed and 220-column print output. But the features of the software program itself are what make that hardware useful. While some other computer manufacturers have built bigger, faster, and more sophisticated machines than the Apple, no one has built a machine that is more flexible or easier to use.

Special Features

Those features of *Data Factory* that I particularly like include a menu-driven start-up routine that asks you a series of questions about the database you wish to design. After selecting a name for the file, you are asked how many fields you wish to specify in each record, up to a

maximum of 88. Each field may be any length up to 239 characters long. You are then asked to enter a maximum length and name for each field. The next step is to tell the program the length of the longest field that you will sort or search, whether you have a printer, and the day's date.

Just that simply, your database has been structured. After that startup session, the program calls its own main menu to allow you to work with the database you have created.

One of the real strengths of the start-up routine is that you don't have to make long-term, unchangeable decisions before you are really sure what the database is going to contain and how you will use it. It is a relatively simple matter to change a field—from 8 characters to 12 characters, for instance—at some later stage.

The item entry in the main menu is data entry. When you select that option, it prompts you for input from the keyboard by displaying the titles of each field you selected and waiting for input. When all field prompts have been answered, the program asks if you wish to store the results in memory or on disk, start over, or correct an item. This last feature allows instant editing without retyping an entire record.

A second data entry procedure allows custom data entry. This mode lets you set up a customized format on the screen, placing constant names anywhere you want, then entering the data to the full screen by using the cursor control keys of the Apple (I,J,K,M) to move the cursor about the screen. You design the custom entry format right on your screen with cursor movements and simple commands.

In addition, a set of control characters lets you back up or move forward a field in the record, whether you have entered anything in the current field or not, advance to the next page, or back up a page. This is a remarkably simple system to use, especially for those situations in which data is incomplete at the time of entry.

Powerful List Command

The list command from the program menu allows you to display your files on either the screen or the printer by selected record number. It gives you three ways to do this: in the order originally entered, in a sorted format, or in the order of the last filter (a special sort that selects and sets up an index of records containing certain data you specify).

The menu then goes through a series of questions about how you want the list

NEC distributors pull miracles out of a thimble.

NEC Spinwriters. Their supernatural reliability and versatility have made them the world's most popular letter quality printers. Here are some of the miracles they can perform for you.

The Spinwriters rapidly growing catalog of print thimbles give you incredible versatility. One NEC thimble can print in 35 different languages. Another has complete technical and mathematical symbols. Another a full scientific symbol font. The thimbles snap in and out in seconds. And they each last for more than 30 million impressions.

Of all printer companies, only NEC designs and manufactures its own comprehensive family of forms handlers. We've got eight of them, enough to handle any form you can conjure up. They're all user changeable, too.

Spinwriters have remarkable reliability, more than two years between failures in normal usage. And they need no preventive maintenance or

presented—print field names, line feeds, continuous print, etc. The list command gives the user great selectivity and flexibility in what he actually sees or what is printed out from the data file.

right justification of fields and the specification of the number of horizontal fields before executing a carriage return.

One of the most powerful of all the capabilities of the program is the custom output routine, which allows you to create custom outputs to the printer or monitor and to operate the comprehensive math functions intrinsic to the program. You control every phase of the final appearance of the report, enter

text of up to 4000 characters any place you wish, place the fields at any location on a form, and print out up to 254 columns wide and 249 lines deep. Using the custom output mode, you can write the particular document back to the disk as a separate file at any time, which I believe is a unique capability among micro-computer database systems.

Unlike most of the rest of the program, the custom output routine demands patience and forethought since it must be told what to do at every step. Once the report looks the way you want it to, the custom format can be saved and called up instantly for future use, or edited still further with powerful editing commands.

Using custom outputs, you can command simple formats such as two-up mailing labels or complex formats such as checkbook entries related to a companion general ledger database structure.

The math and manipulation routines give you such standard operations as addition, subtraction, power, sine and cosine, and random number generation, as well as such complex capabilities as natural logs, conversion of degrees to radians, modular arithmetic, and logical not operation. All are handled in reverse Polish notation, which may be the most

logical kind of computer entry system for arithmetic computation. Instead of saying $2 + 2 =$ as we have been taught from our pencil and paper days, the equation is entered from the keyboard as 2 enter 2 enter +

Move Data To New Format

While Inspect/change functions are common to most databases, the additional update and transfer routines of *Data Factory* allow you to change the existing database input or output structure, then move the data over to the new structure without reentering the data. These are among the most useful and powerful of all the *Data Factory* features in that your own database can grow and change with your needs, rather than being locked into whatever format you set up at the beginning.

A related feature is the construct and append routine, which may be the most powerful routine in the entire system. With the C&A routine, you can add up to 10 new fields to an existing structure, decrease the number of fields, change individual field length, switch field positions around in the file, append records to the existing file, and select which records to transfer by moving them in selected blocks. With C&A, you can selectively back-up individual files on a

disk rather than copying the entire disk, manipulate the previously entered search and sort characters, append files even though the field lengths do not match, and fix a bad record caused by garbled data, hardware error, or even physical fault in the media.

Many Ways To Search

The search routines are highly flexible in *Data Factory*. You can search by record number or by any of the fields. In addition, you may direct a regular search, which will respond to the search characters CAT with CATHolic, CATalog, and CATer. The command to use internal search would also report back such strings as eduCATE and duCAT. Still another search option finds those records that do not match the search category.

The next level of combining the file is the master search routine which allows you to indicate several items to search for ("scope searching," as it is known on minis and mainframes). The process is known in *Data Factory* as using a filter. You construct as complex a filter as you need to conduct a particular search. A screen menu prompts you through every step of the construction of the filter, which also allows you to implement the logical operators "and" and "or" to pro-

duce levels of filter. While levels of filter cannot be added once a filter has been constructed, the command "nop" (no operation) can be designed into the structure and later changed to an "and" or an "or".

Filters can be saved and reused or altered at any time. When a filter is used to process a data file, the index of the file is displayed, showing which records match through all stages and levels of the filter; those that meet all requirements are automatically written to an index on the disk. The save and re-run feature of having the filtered index on disk is a powerful tool for situations in which various reports must be generated over time using the same sorted records.

Like the other routines in *Data Factory*, the sort function allows great flexibility. When entering records, the latest record goes to the end of the file. However, through use of the sort routine, the records can be rearranged numerically, alphabetically, or by date and can be restructured in either ascending or descending order. The *Data Factory* also allows sorting by one-level (the regular sort) or by multi-level which permits up to four levels of sort, such as sorting one field by name and another by date.

The sort routine automatically com-

pacts all files as it is used, giving you maximum data storage efficiency on the disk.

Three Ways To Index

Another powerful, automatic feature of the *Data Factory* is its index routine, which provides three different kinds of indexes to the data in the file.

First, you can print out or display on the screen the first appearance of data in the field searched. The routine will show the record number of that first appearance. Second, you can construct an index for all appearances of the particular search word. Finally, you can get a count of the number of times it appears in a file.

As an example, let's presume that *Data Factory* is being used in a hospital emergency ward. By using the first option, you could search a field called "location of injury." The first option would print out a list: arm, hand, eye, ankle... Using the second option, the listing would present arm 12,23,39; hand 16,26,27,41; eye 6,9,20,45, showing which records contained the search word. By using the third option, the listing would show arm (15), hand (11), eye (7), ankle (12), indicating the number of times each type of injury appeared in the file.

Applying It In Business

In any database manager, the ability to delete data, formats, files, and records is vital in keeping the file up-to-date. With *Data Factory*, which stores up to 10 formats, any one can simply be killed. All such deletions are done from a

You could have Data Factory show everyone in the Boston area, and then schedule visits around those customers and prospects.

prompting menu. Individual files can be killed in one action, which is a great time-saver. Records can be deleted from files individually, in groups according to a common field, or by blocks of record numbers. In many cases, *Data Factory* asks a fail-safe second question to make sure you really mean to delete what you ordered deleted.

How this all can come together in

your business life is shown in the database that you can design using *Data Factory* and use every day in dealing with customers and prospects.

The database could be made up of up to 86 fields and contain all the normal kinds of identifying data, such as name, ownership, address, phone, key contact, estimated paper usage, and so on. In addition, it could contain a section on how the customer handles its paper supplies, storage available, amount used, type of paper used, cores preferred, etc.

Another section could deal with contracts with these customers, how much paper they cover, cumulative sales history in volume and dollars, expiration of contracts, and related information. Still another section could deal with competition: who else the customer buys from, how much, when their contracts expire, plus some confidential information for use in dealing with individual customers.

You could access this information in a number of ways to make your productive hours—the hours spent with customers—more profitable. One obvious way is to check expiring contracts regularly, both yours and your competition's, and then make special efforts against those prime prospects.

Another way might be in scheduling

trips. Say you are going to Boston. You could have *Data Factory* list all your customers and prospects in the Boston area and then schedule visits around them.

Still another use is in emergency situations. Say there is a fire in one of the plants that means production will be down for a significant time. You could have *Data Factory* instantly produce a list of customers who rely on production from that mill, and find them alternative sources of supply even before they know that there is a problem with their primary source. That is the kind of service to which a customer is entitled, but which is very hard to do manually. It is just the mindless kind of filter that the Apple does very well.

Summing Up

Salesmen used to do all those things manually—with a lot of difficulty, pieces of paper, and time. Now they can do them all with an Apple computer and *Data Factory*, and find that they can be more efficient, more valuable to their customers, and especially, more profitable. I recommend *Data Factory* to anyone who needs quick access, with tailored output, to a complex database, but who does not want to become a computer expert. □

If you just bought another computer,
boy are you gonna be sorry.

Epson.

The new Epson QX-10 is unlike any personal computer you've ever seen. It's a computer for people who don't have the time to learn computers; a computer you can be using within minutes.

And fortunately, you don't have to take our word for it. Here's how *Byte*, one of the computer industry's most prestigious magazines, describes the QX-10.

The first anybody-can-use-it computer.

"The Epson QX-10 (is) a computer for less than \$3000 that may well be the first of a new breed of anybody-can-use-it 'appliance' computers ... In addition to being a highly integrated word processing/computer system that offers as much usable processing power as almost any existing microcomputer, the QX-10 ... system is designed to be used by people with minimal technical knowledge. We've certainly heard that claim before, but Epson has delivered on this promise in a way and to an extent that no microcomputer manufacturer has done."

That's nice to hear from a magazine like *Byte*, of course, but it doesn't surprise us. It's just what we intended the QX-10 to be all along.

More computer. Less money.

But useability isn't the only thing the QX-10 has going for it. As *Byte* says, "the QX-10 gives you a great deal for your money."

"Help is available at any time through the HASCI (Human Application Standard Computer Interface) keyboard Help key ... Text can be entered at any time just as you would in a conventional word processor. The Calc key turns the system into a basic

4-function calculator. Graphics can be created via the Draw key. The Sched (schedule) key gives you access to a computer-kept appointment book, a built-in clock/timer/alarm, and an event scheduler."

Advanced hardware for advanced software.

As for hardware, *Popular Computing*, another industry leader, says: "The QX-10 includes ... a number of advanced hardware features ... The basic components of the system are a detachable keyboard, a high resolution monochrome display, and a system unit containing two 5¼ inch disk drives. The drives use double-sided, double-density disks (340K bytes per disk) and are amazingly compact ... The QX-10 uses an 8-bit Z80A microprocessor. The system contains 256 bytes of RAM. Some of the RAM is ... battery powered ... which lets the computer retain information when the power is off."

You won't have to wait much longer.

The new Epson QX-10 may very well be the computer you've been waiting for. And fortunately, you won't have to wait much longer — it will be appearing soon in computer stores all across the country. In the meantime, write Epson at 3415 Kashiwa Street, Torrance, CA 90505, or call (213) 539-9140. We'll be happy to send you copies of our reviews.

After all, as *Popular Computing* puts it, the QX-10 will "do for computing what the Model T did for transportation."

And we couldn't have said it better ourselves.

The Possibilities

You may be getting tired of hearing me rave about the graphics potential of the Atari. Well I'm not going to rave anymore — I am just going to show you some pictures. They will save me thousands of words.

Paint is the most ambitious joystick-based drawing system available for the Atari computer. It has capabilities that outstrip systems that cost five times as much. It allows even the absolute beginner to experiment with most of the graphics potential the Atari brings to microcomputing. And it is so simple, even a child can use it. In fact, it was designed with children in mind. I cannot think of a better inducement to kids than a program such as this.

There are actually two drawing programs included with *Paint*, SimplePaint and Superpaint. SimplePaint is an unimposing, scaled-down version of the main program, Superpaint, devoid of powerful features and therefore also of all complexity. SimplePaint stands more as a tutorial starting point than a valuable program in its own right. It is doubtful whether the user, child or adult, will spend much time with it. Not after he discovers the majesty of Superpaint.

The Features

The joystick is manipulated to move a blinking cross hair around the screen. Press the trigger, and the cursor draws. You may choose from nine different "brushes," in nine different widths, for a total of 81 styles of brushstroke. You may choose a brush that paints a wide swath in one direction, and a narrow one

John Anderson

in another. You can choose a fine line (resolution to graphics 7), or paint huge areas at a time.

At the bottom of the screen ten "paint pots" are displayed. Move the cursor into one of the pots, and press the trigger. Your brush will pick up the new color. Four of these are solid colors, six are patterns — plaids, if you like. Each of these colors as well as their luminosities can be changed. Each of the plaids can be altered as well. They default to a very pleasing set, but it is tough to avoid playing with them.

Next to the paint pots are two other symbols. One is an H, and when the

cursor is moved onto it and the trigger pressed, the help menu appears. Everything about *Paint* can be accessed from its superbly designed system of nested menus. As the user gains proficiency, commands can also be input to the keyboard directly. Thus the system is able to cater to the beginner and the expert alike, without inconvenience to either.

The symbol to the far right, looking like squares within squares, is the zoom symbol. Move the cursor onto it and press, and the picture enlarges to graphics 5. Press it again to move to graphics 3. Move the cursor from within these modes, and smooth scrolling takes place. You can travel smoothly throughout the painting in these magnified modes, doing detailed work with great accuracy.

Other commands place real graphics power in your hands. Aside from the direct drawing mode, you can choose the automatic generation of straight lines, rectangles, and circles. They will place themselves exactly where you indicate, in the size and brushstroke you have chosen. This capability is indispensable in building designs. Once closed shapes have been formed, either freehand or automatically, they can be filled with any color or plaid. The fill coloring is quick, perfect, and fun to watch.

Colors and luminosities can be changed as you look at a painting, or as you look at an electronic palette, which indicates the choice on a rainbow-hued color menu. Plaids can be changed only while you are looking at the color menu. The cursor then becomes a roving square. You choose the pattern you want

by placing the cursor on displayed pattern bars and pressing the trigger.

Other features round out the strengths of the program. The responsiveness of the nondrawing cursor can be damped, as can the responsiveness of the cursor when it is drawing. This may seem a trivial feature, but is very handy when doing detail work. I tended toward using a quick cursor when moving without drawing, and a slower cursor when drawing, for added control.

Okay, so you have created a masterpiece. What to do with it? Save it to disk, of course. Multiple pictures can be saved to a single disk. The Art Show feature allows all pictures on a disk to be displayed. You can use multiple drives, and retrieval time is very quick. You may even number the order in which you want paintings to be displayed. You could conceivably create sequences approaching animation using this technique. Press the space bar to pause on a single picture. Press it again to continue. Another command allows pictures to be deleted.

The Concept

Paint is an effort of SuperBoots, a talented and promising software team working for the Capitol Children's

Museum in Washington, D.C. The programmers are Eric Podietz, Jimmy Snyder, and Mark Scott.

Obviously intended to be an educational package, *Paint* manages to convey fully the flavorful, imagination-spurring mood fostered at the Children's Museum. As a program designed to involve children, it is a masterpiece.

The Shortcomings

Accompanying the remarkable software is an equally ambitious softcover book, which in addition to documenting the package, attempts to present an overview of art history from the dawn of man to the dawn of microcomputers.

On this account it does not do anywhere near as well. The scope of the task, in contrast to the space allotted, nearly dooms it to failure on the launch pad. The fact that the text suffers from a terminal case of the "cutsies" strikes the fatal blow.

Certain passages of the book strike, like a blow to the vitals. "Nothing, with the possible exception of fire, acne, the wheel and sex, will have a greater impact on your life than the computer," reads the introduction to chapter two. A paragraph in chapter three reads "Yes, no, yes, yes, maybe, hmmm, I don't know.

could be, yes, no, no, yes, yes, kind of, oh, who knows?" This kind of driven typifies what some adults think kids eat up. Sorry; only dumb adults, if anyone, see value in patronizing kids.

In fairness, the book is well-intentioned, and includes some handsome color plates, ranging from Matisse to computer-generated graphics by Mark Lindquist. The book unfortunately ignores the work of Tom deFanti, Abel Associates, and MAGI. In its ineffective

Unfortunately, no provision is made for recalling paintings from any other programs.

but passionate argument for the legitimacy of computer-generated art, it nearly makes the case of opponents like Robert E. Mueller (see "When is Computer Art Art," in the January issue). Proponents of computer art will cringe at the uneven and pronouncement-packed propaganda presented in the text of *Paint*.

But wait a minute. The package was designed to stimulate the imagination, and that it does. And despite the fact that the accompanying text is putrid, the package remains superb.

Of course it could have been better. Unfortunately, no provision is made for recalling paintings from any other programs, Basic or otherwise, aside from *Paint* itself. This is a shortcoming that could have been easily set right. Further, the paint pot portion of the screen, which comprises what would otherwise be the text window, cannot be removed, and the images are, therefore, always cropped on the bottom. It was wasteful not to have allowed for paintings to take up all the available screen area, with an option to toggle the paint pots on and off the screen. Perhaps these improvements will appear in a future version of the program.

In the title card of the program, fill routines are used to "animate" the image. It would be wonderful if this power were made available to the user. Reston Software has announced another package, *Quick Flick*, for release shortly. It is an animation development package, which may offer this kind of capability.

Despite my occasionally strong reservations about the text, I unreservedly recommend *Paint* as a must for the Atari graphics enthusiast, and the enthusiast's kids as well. At \$39.95, it is a worthwhile bargain. □

*Our Favorite Games Feature Apples, Paintbrushes,
Frogs, Mines, and an Outhouse*

Owen Linzmayer

Very few computers are advertised as game machines, but we all know that more home computers are being used to battle alien forces than to balance check-books. The TRS-80, although a relatively primitive computer for game playing, has a wealth of arcade software currently available for it. Reviewed here are the six best TRS-80 games I have seen during the last month.

that advertise voice effects offer a much larger vocabulary.

In addition to the printed instructions, *Apple Panic* has thorough documentation accessible from within the program. This includes a scoring table and a review of the controls. The game can be played by one or two players with either the keyboard or a joystick.

The playscreen is divided into five platforms that are connected by ladders.

Apple Panic

In *Apple Panic*, you play the role of a space farmer whose crop of apples has mutated and turned against him. To combat these creatures, you dig holes in the platforms that make up the screen. If an apple falls into a hole, you must bash it until it plummets to its death on the concrete below. If an apple touches you, you lose a life.

The *Apple Panic* packaging promises voice and sound effects. This is a bit misleading. The only time the computer speaks (through the AUX port), is when it displays the banner page. At this time, it says only two words, "Apple Panic." Most of the other games on the market

Crazy Painter

Crazy Painter brightens up a TRS-80 software library just as a fresh coat of paint brings new life to a drab room. It is, as far as I know, an original arcade game unlike any other.

Your job is to maneuver a paintbrush around the playfield, trying to "white out" the entire screen. Your mission is hindered by a group of pests that remove the paint that they walk, slither, and crawl over.

Some of the creatures that you encounter are deadly to the touch, others may be run over by your paintbrush. After you finish painting the screen, you advance to a special bonus round in which all of the monsters are vulnerable to your paintbrush. As the game progresses, the action increases as more aggressive foes attack your paint job.

Crazy Painter is a very professional program designed with user-friendliness in mind. There are three pages of internal documentation complete with animation. The game supports both one- and two-player games. If you want to skip the easy rounds of play, don't worry, there are ten selectable levels of starting difficulty. In addition to this, each player can choose his own level.

Crazy Painter is written entirely in machine language by Robert Pappas, author of *Bounceoids* (see review, December 1982 issue). The major attraction of this game is that instead of being represented on the screen by a little graphics character, you actually create the graphic images on the computer screen. The movement of all of the elements in *Crazy Painter* is remarkably smooth, even at high speeds.

I like *Crazy Painter* because as the game progresses in difficulty levels, different creatures are brought into play,

thus adding variety to the game. The bonus rounds that you encounter after every screen break up the tension and offer a chance to augment your score considerably.

The one complaint I have with *Crazy Painter* is that there are very few sound

effects. Additional sound effects would greatly enhance this game. It has been proven by coin-op game manufacturers that over 50% of the appeal of a game depends on the audio output. I hope more TRS-80 programmers take note of this fact.

Crazy Painter offers a refreshing break from shoot-'em-up games. The idea is novel, and Robert Pappas deserves credit for taking the time to do some innovative programming.

Demon Seed

During the summer of 1982, the theaters were filled with horror films. When I first heard of *Demon Seed*, I mistakenly thought it was the title of a new "insane convict murders entire town" movie. *Demon Seed* is, in fact, a TRS-80 adaptation of Centuri's coin-op arcade game Phoenix.

In *Demon Seed* you control a lone space fighter that traverses the bottom of the computer screen. This ship is equipped with an unlimited supply of ammunition and a protective shield that

can be activated for short periods of time.

The enemy takes the shape of large winged bats and demons. Each attack is made up of five separate waves. The first two attack waves consist of bats flying in formation. During the third and fourth waves, you are confronted by swooping demons that you must hit dead-center to destroy. On the fifth wave, you face the demon attack ship. Before you can shoot its pilot, you must blow a hole through both the belly of the ship and the revolving rim. After you destroy this ship, a new attack wave begins. If you survive two attack waves, you get to try your hand at a special challenge round.

Demon Seed is designed for only one player. Until you become familiar with the workings of the game, it is difficult to attain high scores. If you set one of the top ten scores, you may enter your name (up to 20 characters) to be saved permanently on disk.

The ship is controlled by using the keyboard. In addition to the game controls, there are a few special keys that you should be aware of. You can pause the game at any time by pressing P. If you want to abort the game entirely, hold down both the BREAK and CLEAR keys. To turn off the sound effects, press the BREAK key. Options such as this take

little time to add to a program, but they make a game much more friendly.

The animation in *Demon Seed* is very good. Attacking creatures flap their wings and drop bombs as they swoop down at your ship. At times, game elements flicker, thus detracting from an otherwise excellent graphic display.

Anyone who enjoys playing Phoenix will find *Demon Seed* a game well worth his money.

Frogger

After Frogger, from Sega Electronics, proved itself in the arcades, manufac-

turers began clamoring for the home rights to the game. The Cornsoft Group acquired the rights to produce a TRS-80 adaptation of Frogger, and they did a great job. This licensed version is the best I have seen.

In *Frogger*, you control a small frog that you must maneuver across a bustling highway and past a rushing river. You can move in any of the four compass directions using either the keyboard or a joystick. You must avoid traffic, snakes, crocodiles, and diving turtles. If you get five frogs safely onto their lily pads on the far side of the river, you advance to a more difficult level.

4). If a high score is set, you can enter a name or message (up to 17 characters) which will be saved on the disk.

The thing that bothers me about *Frogger* is that the controls aren't as responsive as I would like them to be. At times you must wait before you can move. This is maddening and results in many miscalculated jumps—usually into the grillwork of an oncoming car and flat frogs.

Frogger lives up the standard for arcade programs set by the Cornsoft Group. I have never been very fond of the coin-op *Frogger*, but I recommend the TRS-80 version to anyone who is.

little bugger before it reaches the bottom of the screen, you are dead. This is a perfect example of a "be perfect or die" situation.

The graphics in *Mad Mines* are absolutely state-of-the-art. The animation of the aliens is excellent and nothing flickers, even when the screen is filled with moving elements. One thing that I do find annoying is that the stars in the background look a lot like the alien bombs. This is confusing and could be corrected by eliminating the scrolling stars.

Rather than simply switch from one screen to another, *Mad Mines* has a variety of transitions that dazzle the player. The graphics demonstrated during these transitions are original and accompanied by sound effects.

Yves Lempereur, author of *Mad Mines*, did an excellent job of creating an all-around enjoyable product. When I showed the game to my co-workers,

most of them commented on how much the style resembled a Big Five program. If you know anything about the TRS-80 game world, you know how respected the Big Five name is. To have one's program compared to a Big Five game is a great compliment.

Mad Mines is one of the most professional arcade games available. It is constantly challenging because it requires both dexterity and strategy. I have a special bunch of games that I keep on-hand to show off to friends—*Mad Mines* has earned its place in that limited group.

Outhouse

So, you have just joined the Inter-galactic Defense Force. The recruiter promised that you'd see Mars, maybe even Venus. Your orders came in today, and guess what—you've been placed in charge of defending an outhouse located somewhere in Iowa. It's a cushy job, but someone has to do it.

For some strange reason, the enemy has launched a full scale attack on the outhouse. Some of the aliens want to destroy the outhouse, others want to de-

The sound effects of *Frogger* are every bit as crisp and whimsical as those found in the arcade. The program beautifully emulates frog sounds of the coin-op game.

One problem many game designers face is how to fit an arcade game onto a computer screen. Remember, most video games have screens that are longer than they are wide; the opposite is true of the TRS-80. Rather than squeeze the play-field down to size, programmer Robert Pappas simply split it in two. When a game begins, you see only the highway. If you reach the other side, the river section scrolls down into place. This is a new, effective way to handle an old problem.

This split-screen technique provides for much more detailed graphics than the versions I have seen that use only one screen. Even with the increased detail, it is easy to lose sight of your frog on the river screen, especially when you are riding on a log. If it were easier to differentiate between graphic elements, the game itself would be greatly enhanced.

One or two people can play *Frogger*, each choosing his own difficulty level (0-

Mad Mines

I have heard it said that borrowing from one source is plagiarism, but borrowing from two sources is research. If this is true, then *Mad Mines* is an excellent piece of software research. *Mad Mines* combines elements of two popular Apple II computer games: *Ceiling Zero* and *Space Eggs*.

In *Mad Mines*, you are in charge of a small space cannon that slides along the bottom of the screen. Your mission is to survive as long as possible while eliminating the mines that infest inner-space. If you shoot a mine, its occupant bursts forth and dives down to attack you. Anything that passes below the force field is restricted to this ever-shrinking space. Each time you kill a flock of mines, a new group appears and the force field is lowered. As the action speeds up, your margin for error diminishes rapidly.

You face a total of four different aliens, each with its own pattern of behavior. The most dangerous of these are the ones encountered on the fourth attack wave. If you shoot an egg during the fourth wave, the creature drops straight down at you. If you don't hit the

move and shoot in eight directions. Running into anything, as well as being shot by an alien, causes you to lose a ship. When you run out of ships or toilet paper, the game is over.

The action starts off slow, but becomes challenging after the first three attack waves have been disposed of. As you progress, the game brings more aliens into play. There is a total of seven different game elements that are programmed to eliminate you, each in its own special way.

Although *Outhouse* is actually a shoot-'em-up game, it has a strange scenario which elevates it above the usual death and destruction arcade game. Both the game concept and the graphics are original, and there is enough variety here to satisfy even the most jaded game player.

The sound effects are crisp and add much to the program. In addition to the normal complement of space war sound effects, the disk version of *Outhouse* is enhanced with voice effects. During the introduction and intermissions, the computer speaks through the AUX port. The voice is a bit coarse, but everything that is said is understandable.

One or two players can play *Outhouse*, alternating turns at the controls. If you set a high score, you are allowed to add your name to the scoreboard. There are two high score charts: all-time, and daily. The top eight all-time scores are saved to disk, whereas the daily scores disappear when the system is turned off.

If *Outhouse* wasn't a good program, it would at least deserve credit for being original. Luckily, it is a great program. I recommend *Outhouse* to anyone looking for a fresh idea in game playing, as well as the hardened arcade addict.

Bugs, Space Ships and Racquetball For The Color Computer

Cheer up all of you TRS-80 Color Computer owners, quality programs are making their way onto the market. I have recently seen many professional quality games that I believe are worthy of praise. The most notable of these are *Doodle Bug*, *Starfire*, and *3-D Brickaway*.

Doodle Bug

In *Doodle Bug*, you move a hungry ladybug through a maze lined with dots while avoiding the predatory insects. Sounds a lot like Pac-Man, right? Well it is, and it isn't. The main difference between Pac-Man and *Doodle Bug* is that the former doesn't have rotating turnstiles. And what a difference they make!

Doodle Bug is an adaptation of LadyBug, a coin-op arcade game by Universal. The object of *Doodle Bug* is to clean out maze after maze of dots. There are other special elements scattered randomly in the corridors that can bring extra points of death. These include: hearts, letters, and skulls.

Doodle Bug is controlled with the joystick, and responds remarkably well to the slightest movement of the stick. After you have the game loaded and running, you never have to touch the keyboard unless you want to freeze the action, or abort the game in play.

One thing I really like about *Doodle Bug* is that the computer screen actually

Owen Linzmayer

looks like a real arcade game, rather than a computer adaptation. *Doodle Bug* features four colors, and the highest resolution graphics I have seen on any Color Computer game. The graphics are very detailed, but the animation of the bugs is slightly jumpy.

One or two people can compete for high scores. Using the right joystick, you choose the number (3-6) of ladybugs with which you wish to begin the game.

This allows for both long and short games.

David Crandall, author of *Doodle Bug*, has done an excellent job of converting LadyBug to the Color Computer. The only change I would like to see made would be to have the aggressive bugs become quicker as the game goes on as they do in the arcade game. As it stands now, the speed of all of the elements remains constant throughout the game. Nevertheless, *Doodle Bug* is challenging and a very good buy.

Starfire

Starfire is a colorful machine language game that combines hi-res graphics and interesting sound effects to create a very playable Color Computer version of the popular arcade game Defender. For the benefit of anyone unfamiliar with Defender, a brief description is in order.

In *Starfire*, as in Defender, you guide a multi-directional space fighter over the surface of an alien planet. Your goal is to protect the helpless people who pepper the planet's surface.

Although the packaging of the software is rather poor, it does not reflect the quality of the game itself. Included with the tape or disk is a single page of documentation which describes the controls, explains loading instructions, and gives strategy hints.

In the rapidly expanding world of educational computing, where can you turn for information on the hundreds of available programs? What subjects and what grade levels are covered? What instructional techniques do they use?

As Bill Gattis, director of our Education Division, puts it, "These were the types of questions not answered in other educational software directories or in typical magazine courseware reviews. To find the answers, we solicited information from the hundreds of software publishers in the educational market and compiled their responses into the Educational Software Sourcebook."

The Sourcebook is the most complete list of information on educational program offerings for the TRS-80 line of microcomputers. Each listing contains a brief description of the program's content, plus its grade level, instructional technique used, hardware required, price and ordering information. In many cases it also includes a "user-reference." This makes it easy for you to find

out more about the program from a school or district currently using it.

The Sourcebook contains a complete subject and grade level index to make finding the programs you need as easy as possible. And it is only \$4.95. You can pick up a copy of the Sourcebook at any Radio Shack Computer Center, store or participating dealer. For more information, contact one of our Radio Shack Educational Coordinators.

For the name of the full-time Educational Coordinator in your area, call Radio Shack's Education Division at 800-433-5682 toll-free. In Texas, call 800-772-8538.

to control. If a coin-op game uses buttons, then the computer adaptation should use the keyboard, rather than the imprecise Radio Shack joysticks. The only problem with the keyboard controls is that the up and down keys (2 and Z) are too far apart.

The screen consists of three separate displays. In the upper left-hand corner is the score box. In addition to the on-screen scoring, there is a graphic display of the number of ships and smart bombs you have left. Located in the upper right is a small radar screen to help you plan your assault on the aliens before they show up on your video.

The main portion of the screen is devoted to the playfield. On the playfield you see your ship, the ground below, and

any invaders that happen to be within firing distance. The scrolling of the landscape is extremely smooth and the alien movements are equally non-jumpy.

Starfire is an excellent adaptation of Williams's arcade classic. If you enjoy Defender, then this program is for you. I am pleased to report that *Starfire* is one of the first programs that uses all of the neat functions of the TRS-80 Color Computer. I hope that Intellitronics will introduce more games of this high standard. I truly enjoyed "reviewing" this game, and I suspect you will be equally pleased.

3-D Brickaway

Soon after joining the local YMCA last year, I took up a new sport, racquetball. Ever since I began playing, I have wondered if it would be possible to write a computerized game of racquetball. My question has been answered. *3-D Brickaway* is a variation of Breakout that is very similar to a single-player racquetball game.

The computer screen shows a three-dimensional view of five walls. The wall at the far end of the court is broken up

into 40 tiles that must be knocked out. You begin each game with five balls. Pressing the fire button on the joystick places a ball into play.

As the ball travels downcourt, its speed decreases, giving the illusion of depth. When the ball hits a wall, it bounces off

at logical angles. If the ball strikes a filled-in portion of the back wall, that tile is knocked out.

To hit the ball, you must manage to keep it in sight through the racquet. If you can do this, you will never have a problem returning the ball. There are two ways to hit the ball: simple deflection and power hit. A simple deflection occurs when the ball hits the paddle and bounces off wildly. For a power hit, you must have the fire button depressed. If you do this, you have more control of the ball, but its velocity increases.

The graphics in *3-D Brickaway* are high-resolution, but not very colorful. The movement of the ball is not as smooth as it could be; this is a case in which graphics were sacrificed for

playability. The paddle responds quickly to the joystick controls, allowing you to get from one corner of the screen to the other in the blink of an eye.

3-D Brickaway is more than a game, it is an example of how three-dimensional graphics can be used on the Color Computer. The excitement of racquetball is lost in the translation from YMCA to computer screen, but *3-D Brickaway* is still a fun game to play and it is very reasonably priced.

Donkey Kong

In the world of arcade games, 1982 was the year of Donkey Kong. Virtually no computer or home video game system is without a program that resembles the original coin-op game. Now, from Tom Mix Software, there is *Donkey Kong* for the TRS-80 Color Computer.

After evaluating many programs that run on the TRS-80 Color Computer, I had concluded that, at best, the Color

Computer was capable of playing only mediocre games; programs of redeeming entertainment values were few and far between. But *Donkey Kong* has changed all that. It is absolutely the best arcade game written for the Color Computer.

In *Donkey Kong*, as in Donkey Kong, you portray Mario the Jumpman. It is your mission to rescue your girlfriend from the sinister clutches of a nasty ape. In your struggle to succeed, you must scuffle about on metal skyscrapers, jump elevators, and avoid fireballs. The path to the top is a hard one indeed.

Donkey Kong takes up a tremendous amount of memory (32K). This is because it has all four screens, like the original coin-op game, in one large program. The popular ColecoVision cartridge of *Donkey Kong* has only the first three screens. Not only does *Donkey Kong* have all of the boards, it presents them in the same sequence in which they appear in the coin-op game.

One or two players can compete alternating turns. There are two game modes: regular and practice. If you choose the standard game, you begin with three men at your command. The practice mode gives you 12 lives. This may seem like a lot, but believe me, they sure don't last long.

The screens are almost identical to those of Donkey Kong, and the game plays similarly. Moving your joystick causes Mario to move around, and pressing the action button makes him jump in the direction he was running. *Donkey Kong* is one of the only Color Computer games that effectively uses the unfortunate Radio Shack joystick controllers.

The graphics of *Donkey Kong* are hires and about as colorful as any Color

Computer game on the market. The animation of the elements is very professional—everything moves smoothly with very little flickering.

Donkey Kong has everything the arcade game has except an "insert coin" message. The sound effects are very good for the Color Computer, and every audio effect of the video game has been woven into this impressive program.

The one complaint I have about the game is that it becomes far too difficult too quickly. I have played many games in the practice mode, and rarely do I get to the fourth and final board (keep in

mind that you get 12 men in the practice mode). The program would be greatly enhanced by selectable difficulty levels. As it stands, you often feel that your demise was not the direct result of your actions, but rather of the cruelty of the program.

It is difficult for me to communicate just how impressive *Donkey Kong* is. If I had to pick one program to show off the Color Computer, *Donkey Kong* would be it. If you call yourself a serious gamer, you can't afford to be without *Donkey Kong*—it alone sits on the game software throne. □

THE DARK CRYSTAL

John Anderson

Jen and the Crystal.

Dark Crystal is an amazing amalgam. Though it is an original, it doubtless shares elements of Lucas' *Star Wars*, Williams' *Masquerade*, and Tolkien's *Lord of the Rings*. It is fantasy adventure and mythic fable; it is the story both of a world and of a boy. It is a film, a microcomputer program, a record, at least three books, toys, even fashions. Oh yes, and it is the latest gift from the main Muppet at Muppet control, Jim Henson.

Who is better qualified, when you come right down to it, to bring a full-fledged fantasy adventure to a mass audience than Jim Henson, Frank Oz, and the other inspired folks who have been packaging fantasy for years now? That they are puppeteers is certainly true, but it is less than the whole truth. They are illusionists, purveyors of pretending, and they focus all their energies on bringing rich imaginary worlds to utter, teeming, show-stopping life.

Henson claims that the project has been in some stage of development for the past five years, but I know better. I can clearly trace its inception to an extremely motley gaggle of monsters, more seedy than scary, an unnamed troupe I can only describe as the "Not Ready for Prime-Time Muppets." They occasionally inhabited the old *Saturday Night Live* program in its heyday (when it was funny), back in 1975 or so. In the few moments per episode they appeared, they invariably stole the show.

The leader of the group was Scred, a snaggle-toothed, baggy-eyed reptile of indiscriminate origins, who looked for all the world like he had smoked too many insects before going on. His world was one of fractured myth, where stone idols shrugged in embarrassed indifference, while helmeted sidekicks evoked peculiar Norse legends. Beside his charismatic anti-hero personality, the most magnetic thing about Scred was his gaze: his eyeballs were positively real. And this was a germ of things to come, a breakthrough of sorts. Scred's eyes were not of felt or plastic, but rather of glass; they had come from a taxidermist.

The legacy of Scred lives on in the icky Skeksis of the *Dark Crystal*, from the reptilian gaze to the "sk" sound in their names. And for all his seventies cynicism, Scred should be very proud to have figured into the ancestry of such a project.

In 1977, Henson took another step toward realizing his ambitious goal. He became aware of the work of fantasy artist

Brian Froud, and was immediately convinced that Froud was the only person who could bring to fruition the characters and world growing in Henson's mind. Froud saw that Henson was the one person who could imbue Froud's creations with life. And so a fortuitous partnership was met—one that I hope will not be disbanded for some time to come.

Another milestone for the project can be accurately marked in 1979, when Frank Oz brought the character of Yoda to *The Empire Strikes Back*. This partnership brought Henson Associates into contact with Gary Kurtz, producer of the *Star Wars* films, and now of *Dark Crystal*. In the following year, when Yoda proved to be not only the major star of *Empire* but the most bankable star in Hollywood, it became apparent that audiences were ready for the kind of fantasy Henson wanted to provide. An-

into the Muppet scheme of things, and has successfully made the transition from opulent mansion to vital, inviting workplace. There I met with the Henson folks, along with Chris Cerf and Roberta and Ken Williams, to talk about the microcomputer version of *Dark Crystal*.

Hobby microcomputerists are by and large no strangers to adventure fantasy; for some, it is the prevalent type of program run on their machines. I wrote about technical advances in the graphic adventure in the August 1982 issue of *Creative Computing*. While the microcomputer adventure is still not quite as popular as other fictional forms, I assert that it is only a matter of time until it emerges alongside the novel, short story, and film as a storytelling medium. You heard it here first, folks.

Further, it will flourish due to its unique, involving, interactive nature. You do not merely observe the action,

Jen and a Mystic.

other upstartish director also took note of this: Steven Spielberg. He made *E.T.* into the Yoda of '82—in fact, he even acknowledges his debt in the film.

Henson's philosophic underpinning is not mysterious. He states it in rather straightforward terms through his alterego, Kermit, at the climax of *The Muppet Movie*. Though I cannot remember the exact lyrics of the finale, the gist is along the following lines: "Hey," Kermit says, "you've been watching a bunch of felt, wire, and trickery for the past two hours, and were swept into what you saw. This is important, because it proves that you can still pretend, and that is something we should always be able to do. That is what keeps us young."

Nestled, one might even say camouflaged, unobtrusively in a fashionable cluster of townhouses on New York's Upper East Side, is the home of Henson Associates. The location fits perfectly

you are a part of it. Your decisions affect the outcome. Your actions count.

Ken and Roberta Williams, the driving force behind Sierra On-Line, are no strangers to the adventure form either. They developed some of its most popular titles, including *Wizard and the Princess*, and the epic *Time Zone*, which has already achieved classic status. Nor is Chris Cerf a novice. He is the writer, publisher, and microcomputer aficionado who has worked with Roberta to develop the graphic adventure *Dark Crystal*.

Don't misunderstand. I'm not saying that computer games using the names and some imagery from popular films are a new thing. But all of the stuff we've seen so far has come out long after the fact, and has built an arcade-style "twit" game out of a few concepts from a film. *Dark Crystal* is the first work to be released simultaneously as film and computer program; and is the

first computer adventure to be based on a feature film.

The Plot Thickens

The *Dark Crystal* is sure to gain cult status in short order. It is the story of a world with three suns, a world once inhabited by three races: the urSkeks, the Gelfings, and the Pod people. They coexisted peacefully and productively, governed by a huge, glowing crystal, which ensured their well-being.

Every thousand years the three suns would come together, and a kind of rebirth would take place in the light of a Great Conjunction. But something happened a thousand years ago, at the time of the last conjunction. The urSkeks schizophrenically split into two separate and opposite beings: the urRu—wise, if passive philosophers—and the Skeksis—

Aughra, Keeper of Secrets.

evil, monstrous tyrants. The Skeksis seized control of the Crystal, and with it, control of the planet. A piece of the crystal itself broke off, and the remaining part darkened. Gelfling prophecy held that the missing shard could be replaced only during the next conjunction, and only by a Gelfling, if the Skeksis were to be destroyed. They would otherwise rule forever.

The Skeksis took what they saw to be positive action to defuse the prophecy: they undertook to kill every Gelfling on the planet. And they very nearly succeeded. With the exception of Jen, raised by the urRu, and Kira, raised by the Pod People, every Gelfling on the planet was murdered. As the banquet scene will verify, the Skeksis simply aren't the kind of folks you invite for dinner.

Jen, of course, is the great Gelfling hope, and with Kira's help, attempts to realize the ancient prophecy. They en-

counter many strange beings, as well as puzzles, dangers, and mysteries en route.

One of these is Aughra, the sorceress, played by Frank Oz. Oz has emerged as perhaps an even more phenomenal puppeteer than Henson himself. His characterizations of Miss Piggy and Fozzy Bear have brought the name Oz a new meaning worldwide. When Yoda's nose twitched reflexively, when his brow crinkled in thought, Frank Oz was playing his trade.

Henson and Froud have worked to present a world as rich in complexity and detail as possible. Some shots of only seconds in length took days to pro-

The microcomputer adventure version of the *Dark Crystal* takes place in exactly this same world, though some very new challenges are offered. You are Jen, and your goal is restoration of the crystal. Knowledge of the film will help you along the way, but the action has new depths and new levels of complexity. Certainly the richness of detail that the film affords will heighten the sense of magic you experience while playing the computer version.

PrintMate™ 150

THE MOST ADVANCED PRINTER IN ITS CLASS.

Good news for microsystem and personal computer users! MPI offers four wide carriage printers with excellence in price and performance. The two "A" versions of PrintMate™ 150 feature a factory installed "SoftSwitch" front panel keypad, with a 4K buffer on PrintMate™ 150 model A1 and a 16K buffer on model A2. PrintMate™ 150 models B1 and B2 are factory equipped with a 2K and 16K buffer, respectively. PrintMate™ 150 models have an exceptional set of outstanding graphics and font capabilities, optional expansion, and other advanced features that differentiate the PrintMate™ 150 from its competitive rivals as the superior performer. A bold claim? The strong and widespread acceptance of the excellent PrintMate™ 150 is based on outstanding user features:

HIGH SYSTEM THRUPUT—150 characters per second advanced logic seeking impact printing with an accelerated print head slow rate and turnaround makes PrintMate™ 150 a high speed performer.

WIDE CARRIAGE VERSATILITY—The PrintMate™ 150's wide carriage can accommodate print lines from 136 to 231 characters in length and can easily handle forms from 3 to 15 inches wide and as long as 31 inches.

LARGE SELECTION OF PRINT CAPABILITIES—The 7x9 dot matrix allows user selection

of 10, 12, 15 or 17 characters per inch or the 11x9 serif font provides document quality printing at 10 characters per inch.

"SoftSwitch"™ FRONT PANEL CONTROL—The PrintMate™ 150 A models have SoftSwitch™ front panel keypads for externally changing forms length, print density, horizontal and vertical tabs, baud rate and character set. A simple "SoftSwitch™" entry will display the operating mode you have selected and PrintMate™ 150 responds to every entry with a pleasant tone of confirmation. With the "SoftSwitch™", you can turn off the printer—even unplug it—and PrintMate™ 150 will retain every detail in its non-volatile memory. The "SoftSwitch™" may be added to the PrintMate™ B models.

EXPANDABLE PRINT BUFFER—PrintMate™ 150 models A2 and B2 have a factory installed 16K buffer. Both the 4K buffer model A1 and the standard 2K buffer model B1 are optionally expanded in increments to 16K. The PrintMate™ 150's expanded buffer allows application extensions for high speed interleaved printing and spooling, greatly improving the host computer's performance in applications that are print bound.

DOWNLINE LOADABLE FONTS—The powerful microprocessor based command set of the PrintMate™ 150 allows a custom character set to be developed in the host computer and downloaded to any Print-

Mate™ 150 model with a 4K or larger buffer. **GRAPHICS**—The standard graphics capabilities of all PrintMate™ 150 models allow printing of up to 6,120 individually addressable dots per square inch giving exceptional resolution for graphics and special characters.

PrintMate™ APPLICATIONS PACKAGES—Turn-key graphics and display fonts can be implemented with an extensive line of MPI supported and maintained AP-PAK™ applications packages providing specialized fonts, custom graphs, tables, and picture graphics. Specialized characters such as logos may be easily defined and edited for printing directly from your computer.

CONSIDER THE FEATURES—Only PrintMate™ 150 offers so many ways to get your message across: graphics; display fonts; downline loadable character sets; high print speed; advanced logic seeking; 15 inch wide carriage; a variety of forms and paper capabilities; and friendly "SoftSwitch™" interaction. The PrintMate™ 150 is the responsive performer that perfectly mates with your microsystem or personal computer. come nearly second nature for Roberta Williams. The *Dark Crystal* project took her a little over a month. "It was easier because the map was mostly already there," she says, "though we've added some surprises." Asking her what comes first in game development is like asking about chickens and eggs. "It evolves as I'm building it. New possibilities always

pop up. The toughest thing sometimes is deciding what to put in and what to leave out, because so much could be there."

Roberta works all her plans out on paper—sometimes huge sheets of wrapping paper—with all sorts of notes heading off in all sorts of directions. No other human being can make much out of

Cerf's Up

Chris Cerf is a renaissance man. He is not only a writer, editor, and publisher (son of the late Bennett Cerf), but the man who got Jim Henson and Frank Oz excited about microcomputers. Both men told me of their interests in the field—Oz is close to purchasing a micro.

When you meet Chris, you realize how infectious his enthusiasm can be. As a frequent contributor of material for TV's *Sesame Street*, the possibilities of microcomputers in education look especially promising to him. As does the general literary potential of the medium.

"The adventure is a perfect way to get 'humanities types' into computers," he says. "Especially the ones lacking in hand-eye skills." One of his jobs at Henson is to act as a bridge between the raw talent on both philosophic banks of the river: those who are strong in programming, and those who are strong in verbal skills. "People like Roberta Williams are quite rare. Most adventures around today are turned out by folks who are programmers, not writers by any means. I'm working to change that."

"I'd like to coax some humor into the form as well," says Cerf. "The

adventure can become a literary medium." He states that storyline, as well as sound and graphics in an adventure program, can achieve a sophistication far beyond anything yet seen.

This bodes well for education as well, according to Cerf. "Adventures prompt familiarity with the keyboard, with textual material, with creative problem-solving, as well as making the user feel a part of what is going on, rather than a mere observer."

He showed me some promising preliminary results of photographically digitized images, and predicted that the photographic approach would eventually replace the current "graphics tablet" approach to adventure graphics. It saves work, as original art can be digitized directly instead of being tediously redrawn. And the results can actually be superior. The current disadvantage is extra memory cost per image. Cerf is undaunted. "We'll get it right."

As for the place of the videodisc in all this, Cerf is only a bit less optimistic. He points out that the cost of mastering a disk remains prohibitive. "It will happen," he predicts. "But we may be talking about ten years from now."

what is there—not without training, anyway. When I asked her why she didn't use a word processor or database package to help with game development, she chuckled. "I guess computers still intimidate me a little bit. I'd just rather work it out on paper."

Ken spoke of how a tiny family business has grown in three short years. "There was a time when the idea of hiring programmers just for translation would have been unthinkable. Right now we're putting a big emphasis on

Preliminary screen art for the micro-computer adventure.

program translation," he says. "We intend *Dark Crystal* to be available for the Apple, Atari, IBM, and Commodore 64 machines. We are also translating many of our other popular games. The demand is there."

Dark Crystal is destined to introduce thousands of computer users to the realm of the computer adventure. I cannot think of any collaboration that could have done nearly as well in the task. To the newcomers drawn to adventuring via *Dark Crystal*: Welcome, and hold on to your hats. The adventure has really just begun. □

"Go" was invented many centuries ago in the mysterious Orient. And now Hayden translates it for your computer, with maddeningly addictive results. It's a deceptively easy game, one you can play against the smartest person you know or against your own computer. And who knows? Maybe in a thousand years or so you'll master it.

"Wargle," on the other hand, is a very modern affair, involving attacks on you by a pack of vicious wolves. Outshoot them and they merely regroup and come at you with greater ferocity. Just when you think you're getting good at this game, you'll find yourself at a new, more dangerous level.

"Go" and "Wargle" couldn't be more different from each other—but they couldn't be more fun. And that's the way Hayden designs games: to be captivating, engrossing, challenging and (above all) totally enjoyable. Want to have more fun with your computer?

Beyond Turtle Graphics

Donald T. Piele

When I run across an interesting computer program while browsing through the pages of a computer book or magazine, I often stop and wonder, "Yes, the program seems to work; it appears to be correct. But how can I write such a program myself?" Sometimes the author supplies hints on how the program works by identifying regions of the program where important things happen.

By studying other people's programs, I frequently pick up new programming strategies and techniques to tuck away for use at another time and place. The most important ideas are usually very simple and packaged in small bundles. They represent little kernels of code that handle some very big tasks.

Mathematicians create new structures in the same way. They approach problems by defining new objects, creating and proving small packages of relationships called *lemmas*, and then posing and proving new theorems by fitting the parts together. The primary reason that mathematics is considered a necessary component of formal education is that it teaches people to organize and attack problems in a structured way.

"Top Down" structured programming, which we hear so much about today in the context of computer programming, is not new at all to mathematicians. They have been doing it for centuries. Euclid's *Elements*, one of the greatest influences on the development of scientific thinking, is primarily known for its skillful selection of propositions and their

arrangement into a logical order. Much of the material found in today's high school plane and solid geometry texts came from this work.

What is different today is that computers have dramatically expanded our options for teaching how to organize and solve problems in a structured way. We are beginning to see new languages and curriculum materials whose major function is to teach analytical reasoning skills through the use of structured programming exercises. One such language that has drawn considerable attention lately is Logo, which was developed under the direction of Seymour Papert at MIT.

Much has been written lately about the problem solving ability of Logo [3,4]. The emphasis in all of these writings is on teaching problem solving using Turtle graphics. There is no question about the effectiveness of Logo in this area. I have tried it, teachers have tried it, kids have tried it, and we all love it. But what is Logo like beyond Turtle graphics?

This month, I would like to examine a non-graphics problem using the Logo language. Armed with the Apple Logo reference manual and Harold Abelson's book, *Apple Logo*, I decided to tackle a problem involving the generation and display of factorials.

Small Factorials

The only place an exclamation point is used in mathematics is to indicate a factorial. For example, $4!$, read as "factorial four," is defined to be the product $4 \times 3 \times 2 \times 1$, which equals 24. A deck of 52 cards can be dealt out in $52!$ or 80,658,175,170,943,878,571,660,636,856,403,766,975,289,505,440,883,277,824,000,000,000,000 ways to be exact. How do you write a program to generate factorials?

Donald T. Piele, University of Wisconsin-Parkside, Box 2000, Kenosha, WI 53141.

Listing 1.

```

TO BEGIN
TYPE ENTER A WHOLE NUMBER-]
MAKE "N FIRST READLIST
MAKE "FACTORIAL 1

LOOP 1
END

```

```

TO LOOP :I
MAKE "FACTORIAL :FACTORIAL * :I
IF :I = :N [PRINT :FACTORIAL
STOP]
LOOP :I + 1
END

```

First examine the following Basic factorial program.

```

10 PRINT "SMALL FACTORIALS"
20 INPUT "ENTER A WHOLE NUMBER- "N
30 FACTRIAL = 1
40 FOR I = 1 TO N
50 FACTRIAL = FACTRIAL*I
60 NEXT I
70 PRINT N;"!="FACTRIAL
80 END

```

Type it in and run it for $N = 12$ and $N = 13$.

```

SMALL FACTORIALS
ENTER A WHOLE NUMBER- 12

12!=479001600

ENTER A WHOLE NUMBER- 13

13!=6.2270208E+09

```

Notice that the above procedure has no provision for being precise beyond nine digits. This causes the switch to scientific notation between 12! and 13!. Try running the program for $N = 33$ and $N = 34$. On the Apple II you will set an overflow error for $N = 34$ since 34! has more than 38 digits—the limit for real numbers in Applesoft.

Now let's take a look at the same problem solved in two different ways using Logo. The first program follows the same logic used in the Basic program. The second version is recursive. Two procedures need to be defined.

"If this one doesn't come up with computer learning aids soon, I'm switching schools."

The two procedures in Listing 1 are written in Apple Logo. The LOOP procedure is equivalent to lines 30 to 60 in the Basic program. Type in both procedures and then type BEGIN. Everything about the Logo program including the nine-place precision and the termination between 33! and 34! is identical to the Applesoft Basic program.

There is a better way to solve this problem in Logo by taking advantage of its natural recursive structure. A recursive procedure is one that calls itself. Factorials are easy to define recursively. For example if we set FACTORIAL (N) = N!

```

FACTORIAL (N) = N * FACTORIAL (N-1)
and
FACTORIAL (1) = 1

```

completely define FACTORIAL (N). This procedure can be implemented in Logo as follows:

```

TO FACTORIAL :N
IF :N = 1 [OUTPUT 1 STOP]
OUTPUT :N * FACTORIAL :N - 1
END

```

Replace LOOP 1 in the BEGIN procedure with the line PRINT FACTORIAL :N. Now type BEGIN to use the recursive version.

Large Factorials

The built-in precision of Basic and Logo is not good enough to display all the digits in $N!$ for large N . How can we correct this problem and generate large factorials with all their digits intact?

Let's begin by writing a Basic program that will print out $N!$ for any whole number N up to 500. See Listing 2.

Listing 2.

```

10 PRINT "LARGE FACTORIALS"
20 INPUT "ENTER A WHOLE NUMBER "N
30 DIM A$(3*N)
40 DIGIT = 1 : CARRY = 0
50 A$(1)=1
60 FOR I=2 TO N
70   FOR J=1 TO DIGIT
80     A$(J)=A$(J)+1 + CARRY
90     CARRY = INT(A$(J)/10)
100    A$(J)=A$(J) - 10 * CARRY
110    NEXT J
120  IF CARRY > 0 THEN C = INT(CARRY/10)
      DIGIT=DIGIT + 1
      A$(DIGIT)=CARRY - 10*C
      CARRY = C: GOTO 120
130  CARRY = 0
140  NEXT I
145  PRINT N;"!="
150  FOR I = DIGIT TO 1 STEP -1
160    PRINT A$(I)
170  NEXT I
180 END

```

The 68 digits (shown earlier) that constitute 52!, took about 45 seconds to generate with this program. The algorithm is exactly what one would use if one had to do it by hand with paper and pencil—simply multiply $1 * (1-1)!$ for $I = 1$ to N . The loop between lines 70 and 110 takes care of the digit by digit multiplication, keeping track of the quo-

tients, the carries, and the remainders. The array A%() holds the digits of the current value of the factorial. The least significant digit is in A%(1) and the most significant digit is in A%(DIGIT). The procedure in line 120 makes sure that the value of the carry does not get out of hand. Finally, lines 145 to 170 print out the digits of the answer in proper order.

Instead of defining arrays, Logo uses words. Table I shows exactly what response you get to the corresponding commands in Logo in the immediate mode.

Command	Response
PRINT WORD 1 2	12
PRINT FIRST WORD 1 2	1
PRINT LAST WORD 1 2	2
MAKE "A WORD 1 2	
PRINT "A	12
MAKE "A (WORD 1 2 3)	
PRINT "A	123
PRINT LAST "A	3
PRINT BUTLAST "A	12
PRINT LAST BUTLAST "A	2
PRINT 13 * 3	39
PRINT QUOTIENT 39 10	3
PRINT REMAINDER 39 10	9

The digits of a large factorial can be stored together in proper order as a *word*. Each digit can be isolated with **LAST BUTLAST**; products can be formed with ***** and individual digits separated with **QUOTIENT** and **REMAINDER**. To solve the problem in Logo, break it up into the following five procedures: **BEGIN**, **FACTORIAL**, **MULTIPLY**, **LONGHAND**, and **SOLUTION**.

```

TO BEGIN
PRINT [LARGE FACTORIALS]
TYPE [ENTER A WHOLE NUMBER -]
MAKE "N FIRST READLIST
(TYPE :N [=] FACTORIAL :N)
PRINT "
END

```

This procedure is the same one used in the limited version.

```

TO FACTORIAL :N
IF :N = 1 [OUTPUT 1 STOP]
OUTPUT MULTIPLY :N FACTORIAL :N - 1
END

```

This procedure is recursive and similar to the one used before. Now, however, the multiplication must be constructed—hence the procedure **MULTIPLY**.

```

TO MULTIPLY :N :B
MAKE "CARRY 0 MAKE "ANSWER "
OUTPUT LONGHAND :N :B
END

```

Each time we make a multiplication, we must start over with an empty answer and a zero for the carry. Now we are ready to perform the multiplication by **LONGHAND**.

```

TO LONGHAND :N :B
IF :B = " [OUTPUT SOLUTION STOP]
MAKE "TEMP :CARRY + :N :LAST IF
MAKE "CARRY QUOTIENT :TEMP 10
MAKE "DIGIT REMAINDER :TEMP 10
MAKE "ANSWER WORD :DIGIT :ANSWER
OUTPUT LONGHAND :N BUTLAST :B
END

```

The last step in each multiplication is to add on any carry that occurs in the multiplication of the most significant digit (the one to the extreme left). This leads us to the SOLUTION.

```

TO SOLUTION
IF :CARRY = 0 [OUTPUT :ANSWER STOP]
MAKE "ANSWER WORD :CARRY :ANSWER
OUTPUT :ANSWER
END

```

If we type in these procedures, then type `BEGIN`, and finally enter the whole number 52, it takes 2 minutes and 45 seconds to compute 52!. Try it!

One of the reasons that I picked the multiple precision factorial problem for investigation was the intriguing designs that can be made with them. In Martin Gardner's book, *Mathematical Magic Show* [2], a chapter is devoted to factorial designs printed out in the shape of triangles, hexagons, and octagons. For example, 105! has 169 digits in the answer which can be displayed in triangular form.

1051=

1
081
39675
8240290
900504101
30580032964
9720646107774
902579144176636
57322653190990515
3326984536526808240

99587290781343681609728
000000000000000000000000

Obviously, only certain factorials can be displayed this way. Which ones are they? If the number of digits in the factorial is a perfect square then it can be printed as a triangle. The factorial for 105 has 169 digits which is a perfect square ($169 = 13^2$). Other factorials whose digital count is a perfect square are listed in Table 2.

Table 2

Factorials	7	12	18	32	50	81	105	140	180	...
Number of Digits	4	5	6	7	8	9	10	11	12	...

What changes are necessary to the Basic program to print out factorials in triangular form? Here is one way to figure it.

First, compute the place where a line feed is needed. It is necessary after printing a single digit and then after printing three more, five more, seven more and so on. This can be handled with a simple loop that counts up to $2^{\text{ROW}} - 1$ for each row.

Second, use the ROW number in tabbing over the correct number of places, HTAB 20 - ROW. The following changes to the printout routine of the Basic program will do the trick.

```

148 I=0
150 FOR ROW = 1 TO N
160   HTAB 20 - ROW
170   FOR J=1 TO 2*ROW - 1
180     I=I+1
190     PRINT AZ(D-I+1);
200     IF I=D THEN END
210   NEXT J
220   PRINT
230 NEXT ROW

```

How to Solve It, continued...

Of course the 20 in HTAB 20 - ROW is designed to handle factorials up to 40 rows long. By the way, it took 3 minutes and 45 seconds to compute 105! in Basic.

Logo's Turn

There are no built-in formatting procedures in Logo. You must create your own. I broke the problem down into three procedures: PRINTOUT, HTAB, AND PRINTROW.

```
TO PRINTOUT :SOLUTION :ROW
  IF :SOLUTION = " [PRINT " STOP]
  HTAB 20 - :ROW
  PRINTROW (2 * :ROW) - 1
  PRINTOUT :SOLUTION :ROW + 1
```

Again, printing out the triangles requires tabbing over 20 - :ROW for each row and then printing (2 * :ROW) - 1 digits from the solution. To do this we must know how to HTAB.

```
TO HTAB :X
  IF :X = 0 [TYPE " STOP]
  TYPE "\
  HTAB :X - 1
  END
```

This procedure is equivalent to the Applesoft HTAB command. The third line (TYPE "\) must be typed in as

```
TYPE "Control Q < X.
```

This means that after the quote sign, type the Q with the control key down and then make one space with the space bar. The last procedure is PRINTROW.

```
TO PRINTROW :X
  IF :X = 0 [PRINT " STOP]
  IF :SOLUTION = " [PRINT " STOP]
  TYPE FIRST :SOLUTION
  MAKE "SOLUTION BUTFIRST :SOLUTION
  PRINTROW :X - 1
  END
```

This procedure is needed to printout out the digits in each row.

We are now ready to incorporate the PRINTOUT procedure into the previous procedures used for generating the factorials. To do this we need to change two lines in the BEGIN procedure.

```
TO BEGIN          becomes      TO BEGIN
.....
(TYPE IN [=] FACTORIAL IN)    (PRINT IN [=])
PRINT "                PRINTOUT FACTORIAL IN 1
.....
```

Type in these procedures and then BEGIN again. If you want to see the printout of 105!, it will take 21 minutes.

Conclusion

One can expect, as a matter of course, that learning a new computer language will take some time. This was certainly true in my case, because I spent the better part of two days working through the Logo procedures to be able to compute and display large factorials. This was a little surprising to me since my experience with the Turtle graphics portion of Logo had been so easy. Even young children find the Logo Turtle graphics easy to use. Beyond Turtle graphics is a different story.

In the introduction to Abelson's book, he writes, "Logo's designers are guided by the vision of an educational tool with no threshold and no ceiling. We try to make it possible for even young children to control the computer in self-directed ways, even at their very first exposure to Logo. At the same time, we believe that Logo should be a general purpose

programming system of considerable power and wealth of expression. In fact, we regard these two goals as complementary rather than conflicting, since it is the very lack of expressive power of primitive languages such as Basic that makes it difficult for beginners to write simple programs that do interesting things."

I am just a beginner with the Logo language and clearly have much to learn yet, but, beyond Turtle graphics, I certainly cannot agree with Abelson's statement. This is the problem. People may assume, as I did, that since kids learn so quickly to work with Logo's Turtle that this ease will also hold for non-graphics problems. I have not found this to be true. Try it yourself with this or other non-graphics problems. Give it to your students to try.

The factorial problem is an example of only one out of five types that we typically place on the International Computer Solving Contest at the junior high level and above. The problems we create touch a wide range of computer problem solving skills which involve words, numbers, simulations, graphics, and puzzles. Teams of up to three students each have two hours to solve all five problems, using a computer language of their choice. On the basis of my experience with Logo thus far, I believe it would be very difficult to compete using Logo.

I want to conclude on a very positive note. I enjoyed working on this little problem solving exercise with Logo, and I intend to continue to solve other problems with Logo. I completely agree with the problem solving philosophy for which this language was developed and so eloquently expressed in Seymour Papert's book *Mindstorms* [3]. Finally, my mind is not made up. I only hope the experts will begin to show us how to use Logo beyond Turtle graphics.

END TAX TRAUMA

We have the perfect way to breeze through the most dreaded task of the year. And you can do it on your computer — even if you're a complete novice.

It's called **The Tax Advantage™**. It's fast and it's a cinch to use.

The program takes you line-by-line through Form 1040 and the other most common tax forms. It asks you for information in plain English, and you type in the numbers. That's all there is to it.

The Tax Advantage™ does complex operations like income averaging with a few simple commands. Not only that, but as tax laws change, you can easily update the tax tables.

Another terrific feature is that it automatically computes your taxes with each entry you make. So you know exactly how each line affects your overall tax picture.

Pick up **The Tax Advantage™**. Simply stated, it's the best way to do your taxes.

But hurry. April's almost here.

The Tax Advantage™ is available for the Apple II and Atari 400/800. Price \$59.95.

Different Kinds of Variables

If a variable is defined outside of a Logo procedure, its value can be changed by keyed commands or by executing any procedure which refers to it. Such a variable is called a Global variable. Now, if you store something in a box, generally you would like it to remain there until you change the contents of the box. You can't count on the contents of a global variable unless you take special care to guard against unexpected references. One way is to give your variables unusual names, e.g. [MAKE "GRANDMOTHER'S.SHIN.BONE 3]. The reason not to use unique variables is the difficulty of remembering what name you assigned. A second technique is to "initialize" every variable in every procedure before you refer to it. Doing this becomes a little tedious when you write lots of procedures. A third method is to use local variables.

Local variables are defined only within the context of the procedure which references them, so no procedure or keyboard entry can alter the value of another procedure's local variables. Further, local variables exist only within a specific execution (or "instantiation") of a defined procedure. This convention of the Logo language (and others as well) is central to the use of input variables (and others) in recursion. Consider the procedure below:

```
TO SQUARE :SIDES LEFT
  IF :SIDES LEFT EQUAL 0 STOP
  FORWARD 25 RIGHT 90
  SQUARE :SIDES LEFT - 1
end
```

When you key SQUARE 4, the Logo interpreter creates an instantiation or copy of the SQUARE procedure for execution. Let's refer to it as 1-SQUARE. The value of the corresponding variable 1-SIDES-TO-GO is 4. When the third line of 1-SQUARE executes, the Logo interpreter creates a second copy of SQUARE; call it 2-SQUARE. What is the value of the corresponding variable 2-SIDES-TO-GO? The answer is three. Executing 1-SQUARE, the Logo interpreter evaluates 1-SIDES-TO-GO as 4 and subtracts one from it, then assigns 3 as the value for the variables 2-SIDES-TO-GO. In successive recursions of SQUARE 4, this is what happens:

COPY	:SIDES LEFT	ACTION
1-SQUARE	4	draw and turn
2-SQUARE	3	draw and turn
3-SQUARE	2	draw and turn
4-SQUARE	1	draw and turn
5-SQUARE	0	stop

The theoretician Dijkstra, inventor of the language Algol and one of the pioneers in the development of programming,

said that once you understood how variables are used in programming, you understand the essence of programming. We believe he was referring to local variables as used in recursion when he said that. Understanding local variables has become more important in the world of systems and commercial programming as well with the use of "re-entrant" code in operating systems. Many such systems have extensive subroutine libraries. When these subroutines use local variables and observe other coding restrictions, they are re-entrant, which means they can be used simultaneously by several programs.

Variables and Abstraction

The Logo turtle can't deal with abstractions. It must go forward some specific amount or turn through some specific number of degrees. When you key FD :some-distance, the Logo interpreter evaluates the symbolic name "some-distance" (looks in the box or storage cell to determine its contents and substitutes that contents for the expression :some-distance).

People apparently can deal with abstractions, but find problem solving easier when they don't have to do so. Most often when a new procedure is being written, people use specific operand values, e.g. FD 100, which they later change to variable form, such as FD :some-distance. The nature of the abstraction involved is common to some other examples of mathematics as well.

The famous mathematician Bourbaki describes the creation of an axiomatic system as proceeding from the mathematician's working out a series of theorems with very concrete examples in mind and subsequently examining the inferences of his theorems to define precisely which characteristics of his examples were used by the theorems. In a third step, he redefines the set of objects to which his axioms apply as that most general class of objects having all those characteristics used in the theorems. That is, he bases his generalization on the operations he performed and not on a list of the characteristics of the example he began with.

We stress that the process through which a child generalizes a procedure after creating a concrete product with a concrete precursor, this child's play, is a particular kind of abstraction of value in the most intellectual endeavors as well.

This mathematical form of abstraction is called reflexive abstraction by Piaget, who sees the child creating his own mind through processes of thought that are like those of Bourbaki's mathematician. This points to the most significant potential impact of computer experience on children developing their minds. Reflexive abstraction may become more "natural" to them than what Piaget calls "Aristotelian abstraction" (abstraction by feature selection and classification) with which Piaget contrasts it. That is, children of the future may more often think like mathematicians than do children of today. □

Predicting the Future

Michael Crichton is a graduate of Harvard University and Harvard Medical School. He worked briefly in medical research while he pursued a hobby that was later to become his profession, writing.

The hallmark of his writing is meticulous attention to detail—he is sure of his facts, thus his stories are eminently believable. Who could doubt that The Great Train Robbery and journey to Zinj (in Congo) really occurred, that a real Terminal Man was (or is) running around somewhere or that The Andromeda Strain is about to infect the earth?

Crichton has turned his remarkable mind and energy in many directions—medicine, research, writing, filmmaking and, most recently toward personal computers. His approach to computerizing the prophecies of the I Ching presented here follow in his tradition of looking at a fascinating subject in meticulous detail with a liberal dose of technology and imagination thrown in. But this time the technology is real (a computer). As for imagination; well, see for yourself.—DHA

Although it is at least 3000 years old, the I Ching, a Chinese method of divination, employs what we would now call a binary technique. In its simplest form, three coins are tossed six times to create a six-line figure of broken and unbroken

Those who consider the methods of the I Ching sacred may find a computer a chilling perversion of ancient beliefs.

lines. This so-called hexagram is then interpreted by consulting the I Ching, or Book of Changes.

This Book is older than the Bible; tradition dates its origin to 1120 B.C., five hundred years before Confucius added his commentaries. Over the centuries the I Ching has been studied as a religious text and a philosophical masterpiece. But the I Ching is also unquestionably a

method for predicting the future, and this aspect has received much attention during the twentieth century.

It is fundamental to the I Ching that the future can be understood in perpetually changing patterns of off/on, yes/no, heads/tails, broken/unbroken. This binary aspect suggests the ancient technique is highly appropriate for adaptation to a computer. One might say that the I Ching treats reality the same way a computer does.

This idea may horrify purists. Those who consider the methods of the I Ching sacred—properly conducted only with ritual, incense, meditation and the complex tossing of yarrow sticks—may find a computer a chilling perversion of ancient beliefs.

But in fact there is no agreement on what makes the system work. One modern expert, John Blofeld, while testifying to the power of I Ching, denies any comprehension of how it works. Thus it is perfectly possible that a computer could cast the I Ching effectively.

For instance, one idea of the way the I Ching works is that your unconscious knows, through psi phenomena, how the coins will turn up even before you throw them, although your conscious mind remains convinced the coin toss is "random." From this perspective, the I

Which is for you?

The Complete Graphics System II

by Mark Pelczarski

Complete Graphics System is written for the non-programmer interested in doing a wide variety of graphics and design on the Apple computer. Included are options for two-dimensional drawing, with lines, circles, ellipses, and an automatic 108-color filling routine. Also, you can mix text with graphics, with various colors, sizes, and spacing, and easily create Apple shape tables. Three-dimensional options allow you to draw, edit, and manipulate 3-D objects in perspective—without having to use coordinates. A 2-disk set of additional text fonts is available separately.

Although both Complete Graphics System II and Special Effects are written for non-programmers, they are provided on unprotected disks, and instructions are included for using the graphics and machine language routines in your own programs.

Special Effects

by Mark Pelczarski and David Lubar

This is also a non-programmer's package, but oriented more toward computer artistry. It's also an ideal complement to The Complete Graphics System II. It has a brush module that lets you "paint" using a joystick or Apple Graphics Tablet, with the screen as your canvas and a choice of 96 "brushes" and 108 blended colors. You can also magnify any portion of the screen 2 or 4 times for detail editing, perform mirror images, exchange colors, and move parts of pictures to other areas of the screen. Also included is a packing routine that lets you store more pictures on each disk.

The Graphics Magician

by David Lubar, Mark Pelczarski
and Chris Jochimsen

This one is written with the programmer in mind; for anyone who wants to put professional quality graphics in their own software. Fast machine language animation and picture drawing routines are included for use in your own programs, and they're extremely easy to use. Using the editors provided, you simply draw your own multicolored shapes, draw their paths, and combine up to 32 independent shapes with paths and starting locations. The result is a machine language animation file that you just add and control with your own program—it does all the graphics work for you! The adventure-game picture editor works the same way: just draw, save, and add the redraw routine to your program. It increases a disk's storage capacity from 12 pictures to hundreds. A tutorial manual is included with examples of controlling animated objects with joysticks, detecting collisions, and a multitude of other useful hints and examples. For samples of what can be done, see any of our game packages, including PIF MAN, Transylvania, and Spy's Demise, as well as those from several other companies using Graphics Magician for the graphics in their software.

All of our graphics products are on unprotected disks for your convenience.

No fee is required for using our graphics routines in other programs. All our license requires is that it is stated that our graphics routines were used. We are also most interested in publishing good, new products, and beyond our graphics software we can offer further help to authors publishing through Penguin Software.

Instead of offering our own superlatives, we recommend that you read what others have said about our graphics products. Listed here are some of the reviews we've found, along with a few quotable quotes.

Diagnostic Disk Controller and System Assurance Package for Apple II

Avoid SYSTEM-CRASH DATA LOSS

Eliminate wasted time and effort, BEFORE data entry, with automatic detection of component defects.

APPLEsurance II is a combination diagnostic and system assurance tool plus a fully compatible disk controller card for your Apple II. Each time you power-on, sophisticated diagnostic routines in ROM mounted on the disk controller card automatically check your basic system hardware. If there is a problem, descriptive messages on the monitor will indicate the location of the problem and, in some cases, indicate the specific component involved.

These automatic checks include MOTHERBOARD RAM, LANGUAGE CARD RAM, PROCESSOR TEST ADDRESS TEST MOTHERBOARD ROM, ROM CARD ROM, and REFRESH TEST. If there is no problem, you have the assurance that your system is working well and you can proceed confidently with your data entry.

Automatic diagnostics take just a few seconds and happen ONLY at power-up. Thereafter, APPLEsurance II in no way interferes with the normal operation of the disk drive controller function of the card. Bypass of these routines is optional.

The second part of the APPLEsurance II system are disk based diagnostic and assurance tests for further and more extensive subsystem checks.

These tests include 16K RAMCARD, 80 COLUMN CARD, DISK CONTROLLER, PRINTER, COLOR, ROM CARD, PRINTER CARD, DISK DRIVE, KEYBOARD, Z-80 CARD, 64/128K RAM CARD, SERIAL CARD, MULTIFUNCTION CARD, MONITOR, and a variety of other peripheral cards.

New tests can easily be added. A liberal update policy is offered.

Suggested retail price of the APPLEsurance II complete with disk controller card, automatic diagnostics plus disk based diagnostic software is \$150.00

The disk controller card with automatic diagnostic alone is \$125.00

Disk based software alone is \$50.00

I Ching, continued...

Ching can be seen as a method of making you aware of what your unconscious is doing.

If this is true, your unconscious is also aware of multiple states of electronic interaction within the Apple computer as it cycles rapidly from one memory location to the next. You touch the keyboard according to some understanding your subconscious has of the state of the machine at that moment.

A more radical statement argues that your unconscious actually controls the outcome of the coin toss, or the state of the electrons within the computer. According to this idea, you touch the keyboard once you have made the state of the computer fit your subconscious wishes and desires.

These speculations are fun and intriguing. It was in the spirit of experimentation that the following program was written—and also in the spirit of laziness. For however one casts the I Ching, a good deal of bookwork is required. Line numbers for individual casts must be noted down; trigrams and hexagrams looked up in tables; derivative hexagrams generated. I find all this tedious, and I am prone to error in carrying it out.

How To Use The Program

The program allows the user to cast the I Ching with coins or with the random number generator of the computer itself.

If done with coins, three similar coins are selected. Heads are given a value of 2, and tails, 3. The coins are thrown and each throw is summed. If the throw is all heads, the sum is $2 + 2 + 2 = 6$. If the throw is two heads, one tail, it is 7; if two tails, one head, it is 8. If it is all tails, the sum is $3 + 3 + 3 = 9$. After each throw, the sum is entered into the computer, which checks to make sure the value is between 6 and 9. After six entries, input stops.

The keyboard is used to cast by computer. Any key or keys can be pressed, at any time or in any order. After six key presses, input stops.

From this point the program proceeds quietly, without beeps or blinks, to generate the hexagrams and their titles. The primary hexagram is drawn, based on the numerical values of the six lines, reading from bottom to top. Pressing any key will add the hexagram number and name, as well as the line values from bottom to top.

An additional keypress creates all possible derivative hexagrams, and prints their hexagram numbers. One should note here that while all authorities agree on the validity of the secondary hexagram, and some agree on the validity of the first nuclear hexagram, the value of the second nuclear hexagram is

controversial. Nevertheless, since some users of the I Ching employ it, I have included it.

A final keypress summarizes the information for the casting, provides a printout option, and ends the program. There is no loop back to run the program again—most users believe that the I Ching should not be thrown too often!

The program does not provide interpretation. To interpret the figures one must consult the Book of Changes itself. The most widely accepted reference is the Richard Wilhelm translation, published in the Bollingen Series by the Princeton University Press. (This program uses the hexagram names of the Wilhelm translation.)

A more modern, and excellent, text is *I Ching*, translated and edited by John Blofeld, available in Dutton paperback. Blofeld's text concentrates on divination, and is lively and interesting.

The oldest translation of the I Ching is by James Legge, a nineteenth century scholar. Re-issued in Bantam paperback, it is considered less satisfactory by many scholars, and is certainly more difficult to use.

Each text devotes several pages of discussion to each hexagram. The text also provides a detailed interpretation of each line of the hexagram. (Users should note that derived hexagrams are interpreted without reference to specific line numbers. One reads the line number notations for the primary hexagram only.)

How The Program Works

Initially, the program loads an array of 64 hexagrams and a lookup array to determine the hexagram number from the individual trigram pairs.

Lines 100-560 accept input from either coins or machine. Individual values are POKED into specific memory locations.

Evaluation begins on line 600. A background is drawn in low-res graphics, and the lines are created by the subroutine at 2000.

To this point, the program is straightforward. But to look up the hexagram numbers, some intricacies must occur. By convention, each hexagram is divided into lower and upper three-line trigrams. Before defining the hexagram, these trigrams must be standardized with string subroutines. (For example, a trigram of three solid bars might represent numerical values of 999, 997, 977, 777, 779, 797, or 979. These seven possibilities must be set to a single standard value before looking the hexagram up in the table.) This standardization occurs in subroutines 2200 and 3000, which convert any three-line trigram to a single number from 1 to 8.

The standardized numerical values are then related to a look-up data table

starting on line 3500 and the hexagram number obtained. Next, the corresponding response string is obtained from the data listing in lines 4000-4660, and the result sent to the screen. For the primary hexagram, this occurs on line 790.

Secondary and nuclear hexagrams are then generated according to accepted rules of transposition. These figures in turn are broken into their component trigrams, submitted to the standardizing string subroutines, and then read from the lookup and response tables.

Modifications To The Program

This program is long, and deletions are certainly possible. The instructions, which begin at line 6000, comprise roughly one fifth of the code. I wrote them elaborately to assist friends unfamiliar with the I Ching, but sophisticated users can shorten this section or eliminate it entirely.

If you want immediate identification of the original hexagram, delete line 690. If you agree with those scholars who consider the second nuclear hexagram a worthless artifact, make the following

Listing 2.

changes:

```

Delete 920-950
Delete 1170-1200
Change 1230 to HTAB 10: PRINT
N1
Delete 1340-1350
And if you agree with the strict
authorities who reject the notion of nu-
clear hexagrams altogether, make the
following additional changes:
Delete 870-910
Delete 1110-1150
Delete 1230
Delete 1320-1330
    
```

The most obvious limitation of the program is that it does not provide interpretation beyond hexagram name and number. The program can, of course, be modified to provide interpretation, though this strikes me as unwise. In the *Wilhelm I Ching*, each hexagram is given roughly 2700 words of interpretation, nearly 17,000 words for all 64 hexagrams. Even if one compressed this material—a step I would hesitate to undertake—one would still face a massive typing job. It makes more sense to refer to a book than to enter even a summary of the text.

However, for those who want the program to go further, the additions in Listing 1 will allow up to 510 characters of interpretation for each hexagram.

In addition, between lines 4700 and 6000, 128 DATA statements must be entered, summarizing the text for each hexagram in order, allowing two statements per hexagram, as the user sees fit.

It is, of course, possible to take the interpretation further, to provide a reading of individual lines; I leave consideration of such changes to whoever is motivated to do them.

An easier modification enables the program to give a sense of time, for questions having to the form "When will such-and-such happen?" The I Ching is often not satisfying in dealing with time questions, but the hexagrams do have seasonal associations, and a table of timing is found on page 225 of the Blofeld translation. It can be easily entered into the program with the following changes shown in Listing 2.

These changes simply increase the number of rows in the response table. Now, referring to the Blofeld table, the response data from 4020 to 4650 must be modified by adding the appropriate month to each hexagram, thus:

4020 DATA THE CREATIVE, MAY
down to:
4650 DATA BEFORE COMPLETION
NOVEMBER

Finally, one can tighten the code. I have not bothered to do so. When, during debugging, I got the hexagram #63 AFTER COMPLETION, I cheerfully quit.

In summary, I have found the I Ching a powerful tool for understanding any question it is posed. I hope this program will stimulate other users to explore the deeper connections between ancient thought, apparently "chance" events, and microchip technology.

Acknowledgements: As a frequent journal reader, I'm sure that bits of previously published techniques have crept into this program; I am grateful to those contributors who have helped me. I would also like to thank Brugh Joy, M.D. for first introducing me to the I Ching.

These two tiny buttons give your customers the choice. With one to engage the self-centering function of the joystick, push the other to disengage it. No tools, turning upside down, they're right at your fingertips. Self-centering is ideal for games and graphics work requiring directional commands only. You'll now enjoy the ease of switching to the non-centering mode for games and work requiring position-to-position changes. The choice is yours.

THE LEMON™ SOURS SURGES

Our crop-The Lemon™, The Lime™, and The Orange™ are designed to eliminate undetected submicrosecond overvoltage transients from electrical circuits. Commonly referred to as "spikes", or "glitches", these transients can cause hardware and software damage to unprotected circuits.

Today's electronic products are often microprocessor controlled - mini and micro computers, televisions, video cassette recorders - to name a few. Each of these products is sensitive to fluctuations in electrical power lines. Power switching devices such as refrigerators coming on and off or air conditioners starting up can be responsible for a momentary surge or spike of electricity in a circuit. Even your local

utility stepping-up transformers to add power at peak load times or an electrical storm passing through can trigger surges. Such surges can cause equipment to falter at times, not to work at peak performance or fail completely. An entire data base can be lost.

Now you can prevent this from happening to you with an AC Surge Protector from Electronic Protection Devices. Each Protector is a solid state clamping device with 6 outlets utilizing modern high speed semiconductor technology. Using our Protectors is as simple as plugging it into any standard three wire duplex outlet then plugging what needs protection into it. Each Protector exceeds the IEEE 587.1980 Guide for Surge Voltages in Low

Voltage AC Power Circuits.

When you compare the cost of computer hardware, software and your time with the price of a Protector (from \$59.95 to \$139.95), you'll want to sour your surges with one of the AC Surge Protectors from EPD, which are available through your local dealer.

YOUR HOME COMPUTER IS JUST THE BEGINNING.

You've got your home finances organized, learned a little French, played a lot of Zork. You have all the software you want.

Yet, something is missing. Introducing Delphi™. The Information, communications and entertainment system that takes you far beyond the limitations of disks and cartridges. The system that's so friendly the whole family can use and enjoy it.

Delphi is what the home computer was really meant for.

HERE'S WHAT DELPHI GIVES YOU NOW.

With a simple telephone call, you can look up anything in a vast research library which includes a 20,000-entry encyclopedia. You can do your banking. Get the news, weather and sports stories you want from several wire services. Check airline schedules and make reservations. Shop from an electronic catalog. Tap into the Comp-U-Store* discount shopping service. Keep track of your appointments. Play games. Get in touch with other people through the electronic bulletin board, mail and "talk" services. Seek advice from other members and volunteer your own expertise. Collaborate on the Delphi novels. Take part in or run a subscriber poll.

That's just the beginning.

SO FRIENDLY, YOU DON'T EVEN NEED OUR HANDBOOK.

Delphi is the easy-to-use, friendly information system. We designed it for humans. You don't have to speak computerese. In fact, you don't even need our friendly handbook. We'll take you on a guided tour right on your screen.

DELPHI™

THE PRICE IS FRIENDLY, TOO.

It's just \$49.95 to establish your Delphi membership and for the handbook to get you started. Then just as little as 85 cents for 10 minutes (\$5 per hour) on-line for most services during home time... evenings, weekends and holidays. Office time, of course, is more.

DELPHI IS COMPATIBLE WITH YOUR EQUIPMENT.

No matter what home computer you have, you can use Delphi. Unlike other systems, Delphi is compatible with all makes and is easily adaptable to any screen size. And you can use just about any acoustic coupler or direct connect modem to connect Delphi to your telephone.

WE PROTECT YOUR PRIVACY.

We designed privacy into Delphi from the start. Our password system prevents unauthorized access. We don't even know your password, and you can change it any time. We can't monitor your transactions or communications. We can't retrieve information except at your request. The safeguards are spelled out in our policy statement and agreed to by our people. A copy is available. We are members of and subscribe to the policies of the Videotex Industry Association.

SIGN UP, LOG ON, BE IN TOUCH.

To sign up and log on, or for more information, just see your dealer. Or get in touch with Delphi. We'll put your computer in touch with destiny.

TRS-80 Graphics Made Almost Painless

John Crew

This is the second article in a three part series. The first segment appeared in the January 1982 issue. Here we discuss some quirks of Level II Basic and describe Vector Plotter, a program that draws lines on the screen between any two points. Vector Plotter can produce random vectors, or you can supply the x, y coordinates of the initial and terminal points of a vector.

Many people don't know what *vector* means because it is often misused. The correct definition—used by mathematicians, engineers, and scientists other than biologists—is a line which has two properties, length and direction. Some programmers use vector to mean *array*. Airplane pilots and science fiction writers often use it in place of *direction*. Biologists use vector to mean "a disease carrying organism."

Peculiarities of Level II

There are two problems with the VAL function, which are not mentioned in the reference manual. The first problem is that VAL doesn't recognize numeric character strings preceded by a minus sign if there are blanks before the minus sign. That problem was described in Radio Shack's "Microcomputer News" (Oct. and Nov. 1980 issues). The second problem is that if a percent symbol is the

first nonblank character after a string of numeric characters, an SN (syntax) error message will be printed when VAL is used on that string.

Apparently the programmers at Microsoft were uncertain about what should be done in this case. They could divide the value by 100 to get a decimal equivalent, they could leave the number as a percentage, or they could have an error result and leave it to you to write an error handling subroutine to perform whichever calculation you want.

They chose the latter option, but for some reason they call it an SN error instead of an FC (illegal function argument) error. Listing 1 demonstrates both problems with the VAL function. Listing 2 shows the extra lines needed to make the program in Listing 1 work as desired.

If you want the decimal equivalent of a percentage instead of the percentage returned by VAL, then use an error handling subroutine like the one in Listing 2 but insert /100 after

```
LV=VAL (LEFTS(B,K-1))  
in line 100.
```

Because I often want compact programs, I sometimes use IF-THEN state-

ments with an implied THEN. The Level II reference manual doesn't say when THEN is unnecessary, so by experiment I discovered when it can be omitted.

Figure 1 shows different legal IF-THEN-ELSE statements, most of which use an implied THEN, that don't work properly.

The first two examples in Figure 2 have the same error. In a compact IF-THEN-ELSE statement with an implied THEN, if the logical expression ends with a string constant, the THEN branch works properly, but the ELSE branch will be ignored. That problem can be solved by reversing the last comparison (so it is "YES"=IN\$) or by inserting a comma, blank space, or THEN between the logical expression and the THEN branch.

Another solution would be to put parentheses around the logical expression. That problem is one of the few cases I know of which can be solved by inserting a space; Level II usually ignores spaces.

An odd IF-THEN-ELSE statement I found doesn't have a THEN branch. It is

```
IFA=BELSEPRINT"NOT EQUAL"
```

If the logical expression is true, nothing is done, otherwise the ELSE branch is taken.

I suggest you avoid using unusual forms of IF-THEN or IF-THEN-ELSE state-

BUY SOME TIME FOR \$169

Time is money. You have a computer system because you know that it saves you money by simplifying procedures and reducing time normally involved in your work. Time is an important resource which should not be wasted. You are wasting valuable time if you ever wait for your printer.

No waiting. Now with Microfazer by Quadram there is no more waiting.

Microfazers are inexpensive universal printer buffers which any computer user cannot afford to be without. Any computer—any printer (or plotter!), whether parallel or serial. Microfazer receives information from the computer at ultra high speeds causing the computer to think the printer is printing just as fast as the computer can send. Microfazer holds the information until your printer can handle it, and then sends it on.

More copies. Microfazer is equipped with a copy feature allowing additional copies of the buffered information—from one to as many as you want—with the mere press of a button. When you need your information repeated, for whatever reason, it's always right there—inside Microfazer.

Microfazer™ stack. Microfazer can be stacked with popular modems or other peripherals. Some models can plug directly onto the back of your printer. Install it in less than 60 seconds, and choose the amount of buffer memory you need—8K, 16K, 32K, or 64K. One model even comes with up to 512K! You may use several Microfazers in series to create just what's right for you. Take data in from a serial computer and out to a parallel printer. Or

in from a parallel computer and out to a serial printer. Microfazer is just as flexible as you need it to be.

Low price. Only \$169 for 8K of buffering, \$189 (16K), \$225 (32K) and \$299 for a full 64K. Serial-to-Parallel, Parallel-to-Serial and Serial-to-Serial models have slightly higher prices.

Examples of Legal IF-THEN-ELSE statements

Example	Indicator of Separation of Logical Expression and THEN Branch	Notes
IF A=B THEN C=0 ELSE C=1	THEN	
IF A=B, C=0 ELSE C=1	Comma	A comma works like THEN. This is allowed because some other versions of Basic allow it.
IF A%=B%C%=0 ELSE C%=1	Type declaration character (\$,%!,#)	
IF A=1/(B+1) C=0 ELSE C=1	Parenthesis	
IF A=B PRINT "SAME" ELSE PRINT "DIFFERENT"	Basic keyword	
IF A=B : C=0 ELSE C=1	Colon	The colon takes the place of THEN here, but as Figure 2 shows, this doesn't work if you want the THEN branch to be an implied GOTO then branch.
IF A=1B=-1 ELSE B=10	Transition from numeric character string to a variable name which doesn't start with E or D.	
IF A=0, 1000 ELSE 2000	Comma	IF A=0 GOTO 1000 ELSE GOTO 2000 is equivalent.
IF 10=A%90 ELSE 100	Type declaration character	Equivalent to IF 10=A% GOTO 90 ELSE 100
IF A=8/(B+1) 100 ELSE 90	Right parenthesis	Equivalent to IF A=8/(B+1) GOTO 100 ELSE 90

CONGRATULATIONS.

YOUR VISICALC™ JUST DOUBLED IN VALUE.

New Super Expander Plus™ pre-boot
for Ramex-128™ board upgrades any
Apple II™ 16-sector VisiCalc™ to look
like the Advanced Version.

SUPER EXPANDER PLUS keeps all your existing VisiCalc facilities, and adds variable column width, global formatting of numbers, negative numbers in brackets, password protection, new format commands, tabbed fields, the works. It even supports an 80-column card if one is present.

If 128K is enough, you can get all these features with just one Ramex-128 board. But SUPER EXPANDER PLUS supports two Ramex-128 cards to give you an incredible 256K VisiCalc file, and dumps the whole model back and forth to floppies in less than 40 seconds.

There's simply no other memory expansion/software combination

that even comes close. All this others give you less memory, take longer to load and save (as much as fifteen minutes longer!), and cost more for what you get. You're not to see it to believe it. Quick! Call your dealer.

Ramex-128 card, just \$499.

If you're ready to learn intermediate BASIC programming

STEP BY STEP TWO IS READY FOR YOU!

In Each Parentheses, Choose One:

If you're one of the (happy, smart, ecstatic) thousands who learned (quickly, clearly, non-boringly) to use their APPLE computers with our beginners' BASIC tutorial, *The New Step By Step*, then we (know, believe, swear) that *Step By Step Two* is ready to (ease, breeze, squeeze) you into the (advanced, intermediate, grown-up) world of PEEK and POKE, hexadecimal numbers, concatenations, and (much, much, much) more.

On the other (hand, foot) if you didn't (grow with, thrill to, involve the whole family in) the PDI (learning, hands-on, fun) experience, here's what you missed:

- Teaching techniques that teach
- Involvement you enjoy
- Sounds that spur you on
- Graphics that simplify the complex
- Animation that makes this tutorial a stimulating experience.
- A friendly voice that guides you to course completion

The Step By Step Two program works this way:

- the computer program sets up screen displays or sample programs for you.

- the cassette voice tells you what's happening.
- you (deal with, figure out, guess at) the answer.
- the computer (praises, pans) your work.
- you (peruse, plunge into, practice in) the Work Book.
- after each lesson, you're (quizzed, queried, questioned).
- you're then (prepared, practiced, primed) for the next lesson.
- the final exam reveals all (superstars, slackers).

There's lots to learn in *Step By Step Two*:

- PEEK & POKE
- Default values
- Memory map
- CALL program
- ASCII codes
- hexadecimal numbers
- machine monitor
- string logic
- string arrays
- high resolution graphics
- screen memory
- CHR\$ and ASC functions
- control characters
- RAM vs ROM

But don't take our (word, words, wordiness) about how (good, great, grand) *The Step By Step*

method is. Listen to our (critics, reviewers, friends):

"If you want to learn BASIC or would like a little guidance and encouragement added to what you already know, then the way to go is *Step By Step*."
— Softalk

"The *Step By Step* approach is the next best thing to having an experienced programmer by your side... *Step By Step* is a superb example of a successful blend of various media. The teaching principles are sound, the execution is virtually flawless, and the whole thing works."
— Popular Computing.

If you want to move ahead in BASIC programming, the next (simple, logical, shrewd) step is *Step By Step Two*.

Step By Step Two is available at fine retail stores or direct from PDI for \$89.95 plus \$3.00 shipping and handling. (The package includes back-up discs.)

P.S. If you've yet to take your first step into BASIC, it's time to get *The New Step By Step*! Same great tutorial techniques, for \$79.95 plus \$3.00 shipping and handling.

IFI=9:10ELSE20	Colon		If true, a SN error results. If false, nothing happens.

* If true, the THEN branch is used; but if false, the ELSE branch is never taken. See article for a list of solutions to this problem.

** The ELSE branch is used if false. Because E or D if used before an exponent the assignment statement is considered part of the preceding logical expression.

*** This is interpreted the same as ((A=BC)=-1) which has a logical expression within a logical expression. It is equivalent to A=BC.

ments because line renumbering programs, Basic compilers, and other versions of Basic almost certainly won't allow such things. Besides those problems, using odd formats of Basic statements makes your programs hard to read or debug. Only use unusual forms of Basic statements if you desperately need to save memory or you want your program to be incomprehensible.

Multiple IF-THEN-ELSE statements

I often use complex, multiple IF-THEN-ELSE statements to consolidate a long process into one program line. This eliminates many GOTO statements so the program is easier to read and runs faster. The Level II manual isn't very helpful in explaining how to write complex, multiple IF-THEN-ELSE statements and it even gives an incorrect example on page 4/17. Contrary to the claim in the manual, you can't nest IF-THEN-ELSE statements within an IF-THEN-ELSE statement. (The writers of the manual were thinking of Fortran or perhaps PL/I.) ELSE is matched with the most recent THEN (or implied THEN) in that program line. See the following listings for examples.

How To Use Vector Plotter

In the instructions you will see the maximum number of pairs of endpoints which can be stored (which is the same as the number of vectors which can be stored). The maximum number of vectors is calculated in line 100 based on the amount of free memory. The formula was arrived at by experimentation. Some free space is left for use by Basic. The more free memory you have, the smaller the percentage used for the coordinate array.

After the instructions, you are asked if you want random vectors. Usually, my programs look for Y and anything else is treated as no, but in line 150 of Vector Plotter you must reply Y or N.

If you don't want random vectors, you are next asked how many vectors you want to enter. You should ask for as many or more than you expect to enter. The computer then asks for the coordinates of the initial and terminal points. After you enter each pair of endpoint coordinates, the number of endpoint pairs entered so far is printed. You may leave this loop early by pressing the S key instead of entering coordinates. To see instructions, press the H key instead of entering coordinates. H and S are recognized only when they are pressed before you have typed anything in response to an input request.

Entering Coordinates

If you want a nonzero x coordinate, type it first. Then if you want a nonzero

y coordinate, type a decimal point followed by the y coordinate. If the y coordinate is only one digit, put a zero between the decimal point and the digit. If you press ENTER without typing anything, the x and y values are set to zero by default. To backspace and erase the last character, press the key as usual.

The x coordinate must be between 0 and 127. The y coordinate must be between 0 (bottom of the screen) and 47 (top of the screen)—the y coordinate is inverted from the standard Level II use by subtracting the requested y coordinate from 47.

The computer constantly checks to see if the value you typed has an x or y coordinate which is too high or too low. If either the x or y coordinate is too high or too low, the last digit entered

THE SYNETIX SOLID STATE DISK EMULATOR FOR THE APPLE, INCREASES

The Synetix Solid State Disk emulator operates identically to the standard disk drive, but **responds much faster** for programs using disk I/O. The SSD also saves wear on your mechanical drive and diskettes.

The Solid State Disk Emulator is compatible with DOS 3.3, Pascal, SofTech p-Systems IV.O, IV.I, and CP/M operating systems. Call us for a complete list of compatible software and benchmark results on aforementioned systems.

Database management, word processing and file manipulation programs can run up to 1000% faster.

A single board fits any slot and can respond as one or two

SPEED UP TO 1000%. mechanical disk drives. The SSD requires no external modification and uses only 150 ma power supply or per board.

Two Models are now available at new low prices. The Model 2201 (147K) single disk is now only \$395.00. The Model 2202 (294K) dual Disk is \$695.00.

these functions is the sum of a constant and a sinusoidal function of the angle. This results in completely new patterns, some of which are visually quite striking.

A Basic source listing and some sample output pictures accompany this article. To use this program you will need a Tektronix 4050 series terminal/computer. However, the algorithm can be adapted for other computer systems if

the screen resolution is sufficiently high. Most home computers do not have enough CRT screen resolution; in this case you will need a good mechanical X-Y plotter. Note that the graphics commands (MOVE, DRAW, WINDOW, VIEWPORT) used here are specific to the Tektronix 4050 series computers.

The program is easy to use. It prompts the user, asking for values of the input parameters N, L, D, and G. N selects a polar coordinate function. L is an angular frequency coefficient. D is

the increment in radius that is added between angular sweeps. G is the increment within an angular sweep.

When the program asks for a value of the parameter T1, enter a 1 from the keyboard. The picture will be plotted and a list of input parameter values will be printed at the bottom of the screen for future reference. Then clear the screen and hit RETURN, and the same picture will be plotted again, this time without a parameter list.

If you enter a 2 for T1, instead of a 1,

you get a "clean" plot (no parameter list) the first time. The program must be run again for each new design you make.

Table 1 lists the ranges of input parameters that I have found to give good designs. However, values outside these intervals may also work well. The patterns seem to repeat for L values larger than about 60 (with G=5). Note that L, D, and G can be decimal fractions, such as L = 16.5. This program is one of several I have recently written. The others will appear in future issues. □

Library Catalog

A Program For Creating A Personal Computer Based Library Catalog

Jeremy M. Hellman

Homes, schools, and office libraries eventually fall victim to the one characteristic that makes libraries unique: they are the only business whose inventory is constantly growing.

My house is a good example of the problems that this constant expansion can cause. Our living room, master bedroom, children's bedrooms, my office, my wife's study room, the kitchen, and even the dining room are lined with bookshelves. Every year I trudge to the lumber yard for more wood to make more bookshelves.

Through much searching over the years I have gotten a general idea of where different books are kept, and once I even tried to put them on shelves in a systematic fashion. Now, however, most of the systematization has been lost, and it is more a matter of where there is room on the shelf than where the book came from or should be that governs where it will be returned.

Further complicating matters is the fact that many of my bookshelves have been built with shelf spacing that will accommodate only small paperback books. Additional problems arise in looking for a book which has been lent to someone.

Large libraries have traditionally

kept track of their books with a card catalog and a system of check out slips to track the books out on loan. The card catalog indexes books in three ways: by title, by author, and by subject. Each nonfiction book is given a catalog number according to either the Dewey Decimal System or the Library of Congress system, and fiction books are catalogued alphabetically by author. Some large libraries have recently implemented computerized check in/check out procedures, but the card catalog is still a universal fixture in most libraries.

Small libraries, those with fewer than 6000 books, have had to either make do with a librarian (usually self-appointed) with a good memory, or implement the full scale card catalog and sign in/sign out systems used by a larger library.

Homes libraries, with fewer than 2000 books, usually go without any sort of organization at all. The main price that must be paid for running a small library without any type of catalog and sign out system is not being able to find a particular book when it is wanted. Another is that no record of books owned is available

for insurance purposes.

A small computer with a disk drive provides an ideal tool for keeping track of books in a small library. The computer has the ability to store data on large numbers of books and sort the data by title, author, subject, borrower name, or even size, if desired. The availability of small computers in homes, offices, and schools leads to the use of the machine as a book catalogue.

What The Program Does

The Library Catalog Program described here allows you to create and use a computer based card catalog. It is written for an Apple II+ computer with one disk drive and 48K of memory.

With the Library Catalog Program books can be entered or searched for, records modified, books checked in or out, information on borrowers or borrowed books obtained, and all books in the catalog listed. Data for approximately 1000 books can be placed on a mini-floppy disk. If your library is larger than 1000 volumes, use additional disks for data storage. This program is written to lead you through a file for which data is contained on more than one disk.

The program is versatile. For example, a search by author will turn up all books by the desired author or

authors. Thus if you are looking for books by Masters, Library Catalog will turn up all books by Masters as well as those by Masters and Johnson. A search on Masters and Johnson will sort out all those by Masters and Johnson, but not by each author individually. In searches on subject, any of three levels of specialization can be selected. Entries are easily modified, and all output data is presented in readable form.

What sets this program apart from other data base routines is a sequence in which the catalog number of the book is determined. Menus which lead to greater and greater specialization of the book subject matter are provided. The Dewey Decimal System has been used and provided for three levels of detail: the division, the category, and the subcategory. For example, the book *Thermodynamics*, by Sears would be catalogued into the division Pure Science, the category Physics, and the subcategory Heat.

Should a book on the history of science be catalogued under science or history?

A library school graduate would probably have very definite ideas as to exactly how books should be catalogued. For example, should a book on the history of science be catalogued under science or history? Established libraries have a set policy on this type of decision. For an uncatalogued or home library you are the judge and common sense and consistency in assigning numbers will enable a search to turn up all pertinent books.

The program is completely menu driven and all inputs are made as "bomb-proof" as possible. The length of the program is in a large part due to the checking of the validity of each input and an attempt to make the instructions very friendly and clear.

The program is written so that no knowledge of computer programming is necessary to do any of the cataloging operations. The detailed description of the program given in this article is presented to enable the more advanced programmer to modify the routines, and the beginning programmer to understand the program logic. If your only interest is in cataloguing your library, simply type in the program exactly as listed, and use it as described in the next section.

How To Use The Program

Once you have successfully entered the program and created the data files using the routines supplied, entering books into the catalog can begin.

and shelf number. For example, the ID of a bookshelf with the description "Melissa's room, desk bookshelf, top shelf" would be MD1.

Run Catalog Master, and the computer will ask for the number of disks containing catalog data (zero in this initial case), and the menu shown in Figure 1 will appear on the screen. Select the bookshelf option (6), and a new menu will appear (Figure 2). Choose (1) to add shelves to the library, and follow the instructions to supply ID, size (S-short; N-normal; T-tall), and location description. When all shelves are entered, return to the menu and select (4), END SHELF OPERATIONS.

The primary menu will appear once more, and selection (1) will permit book entry. A message asking you to replace the Catalog Master disk with a disk for book data storage will appear. When this is done the program will tell you how many books are currently in storage on the disk. Once again, it is zero in this initial case.

The computer then requests title, author, location ID, and whether the book is fiction or nonfiction. If the book is nonfiction, the cataloguing process proceeds. For example, the book *I Hear America Talking* would

AARDVARK — THE ADVENTURE PLACE

ADVENTURES FOR OSI, TRS-80, TRS-80 COLOR, SINCLAIR, PET, VIC-20

ADVENTURES — Adventures are a unique form of computer game. They let you spend 30 to 70 hours exploring and conquering a world you have never seen before. There is little or no luck in Adventuring. The rewards are for creative thinking, courage, and wise gambling — not fast reflexes.

In Adventuring, the computer speaks and listens to plain English. No prior knowledge of computers, special controls, or games is required so everyone enjoys them — even people who do not like computers.

Except for Quest, itself unique among adventure games, Adventures are non-graphic. Adventures are more like a novel than a comic book or arcade game. It is like reading a particular exciting book where you are the main character.

All of the Adventures in this ad are in Basic. They are full featured, fully plotted adventures that will take a minimum of thirty hours (in several sittings) to play.

Adventuring requires 16k on Sinclair, TRS-80, and TRS-80 Color. They require 8k on OSI and 13k on VIC-20. Sinclair requires extended BASIC.

TREK ADVENTURE by Bob Retelle — This one takes place aboard a familiar starship and is a must for trekkies. The problem is a familiar one — The ship is in a "decaying orbit" (the Captain never could learn to park!) and the engines are out (You would think that in all those years, they would have learned to build some that didn't die once a week). Your options are to start the engine, save the ship, get off the ship, or die. Good Luck.

Authors note to players — I wrote this one with a concordance in hand. It is very accurate — and a lot of fun. It was nice to wander around the ship instead of watching it on T.V.

CIRCLE WORLD by Bob Anderson — The Alien culture has built a huge world in the shape of a ring circling their sun. They left behind some strange creatures and a lot of advanced technology. Unfortunately, the world is headed for destruction and it is your job to save it before it plunges into the sun!

Editors note to players — In keeping with the large scale of Circle World, the author wrote a very large adventure. It has a lot of rooms and a lot of objects in them. It is a very convoluted, very complex adventure. One of our largest. Not available on OSI.

HAUNTED HOUSE by Bob Anderson — This one is for the kids. The house has ghosts, goblins, vampires and treasures — and problems designed for the 8 to 13 year old. This is a real adventure and does require some thinking and problem solving — but only for kids.

Authors note to players — This one was fun to write. The vocabulary and characters were designed for younger players and lots of things happen when they give the computer commands. This one teaches logical thought, mapping skills, and creativity while keeping their interest.

DERELICT by Rodger Olsen and Bob Anderson — For Wealth and Glory, you have to ransack a thousand year old space ship. You'll have to learn to speak their language and operate the machinery they left behind. The hardest problem of all is to live through it.

Authors note to players — This adventure is the new winner in the "Toughest Adventure at Aardvark Sweepstakes". Our most difficult problem in writing the adventure was to keep it logical and realistic. There are no irrational traps and sudden senseless deaths in Derelict. This ship was designed to be perfectly safe for its' builders. It just happens to be deadly to alien invaders like you.

NUCLEAR SUB by Bob Retelle — You start at the bottom of the ocean in a wrecked Nuclear Sub. There is literally no way to go but up. Save the ship, raise her, or get out of her before the blows or start WWII.

Editors note to players — This was actually plotted by Rodger Olsen, Bob Retelle, and someone you don't know — Three of the nastiest minds in adventure writing. It is devious, wicked, and kills you often. The TRS-80 Color version has nice sound and special effects.

EARTHQUAKE by Bob Anderson and Rodger Olsen — A second kids adventure. You are trapped in a shopping center during an earthquake. There is a way out, but you need help. To save yourself, you have to be a hero and save others first.

Authors note to players — This one feels good. Not only is it designed for the younger set (see note on Haunted House), but it also plays nicely. Instead of killing, you have to save lives to win this one. The player must help others first if he/she is to survive — I like that.

PYRAMID by Rodger Olsen — This is one of our toughest Adventures. Average time through the Pyramid is 50 to 70 hours. The old boys who built this Pyramid did not mean for it to be ransacked by people like you.

Authors note to players — This is a very entertaining and very tough adventure. I left clues everywhere but came up with some ingenious problems. This one has captivated people so much that I get calls daily from as far away as New Zealand and France from bleary eyed people who are stuck in the Pyramid and desperate for more clues.

QUEST by Bob Retelle and Rodger Olsen — THIS IS DIFFERENT FROM ALL THE OTHER GAMES OF ADVENTURE!!!! It is played on a computer generated map of Alesia. You lead a small band of adventurers on a mission to conquer the Citadel of Moorlock. You have to build an army and then arm and feed them by combat, bargaining, exploration of ruins and temples, and outright banditry. The game takes 2 to 5 hours to play and is different each time. The TRS-80 Color version has nice visual effects and sound. Not available on OSI. This is the most popular game we have ever published.

MARS by Rodger Olsen — Your ship crashed on the Red Planet and you have to get home. You will have to explore a Martian city, repair your ship and deal with possibly hostile aliens to get home again.

Authors note to players — This is highly recommended as a first adventure. It is in no way simple — playing time normally runs from 30 to 50 hours — but it is constructed in a more "open" manner to let you try out adventuring and get used to the game before you hit the really tough problems.

ADVENTURE WRITING/DEATHSHIP by Rodger Olsen — This is a data sheet showing how we do it. It is about 14 pages of detailed instructions how to write your own adventures. It contains the entire text of Deathship. Data sheet — \$3.95. NOTE: Owners of OSI, TRS-80, TRS-80 Color, and Vic 20 computers can also get Deathship on tape for an additional \$5.00.

PRICE AND AVAILABILITY:

All adventures are \$14.95 on tape except Earthquake and Haunted House which are \$9.95. Disk versions are available on OSI and TRS-80 Color for \$2.00 additional.

ALSO FROM AARDVARK — This is only a partial list of what we carry. We have a lot of other games (particularly for the TRS-80 Color and OSI), business programs, blank tapes and disks and hardware. Send \$1.00 for our complete catalog.

When all books are entered, the Library Catalog Program can be used for searches, recording borrowed and returned books, and listing all books on file. The menu for searches is shown in Figure 5.

If the SUBJECT/FICTION TYPE selection is made, the classifications are once again presented to aid in subject selection. For information on borrowing, the menu shown in Figure 6 enables several selections. Option 3 from the main menu, permits any record to be modified, from check in/check out to correction of spelling to complete deletion of the book from the file.

Somehow, Did Your Last Raise Seem Insignificant?

1983 Computer Salary Survey and Career Planning Guide

New, Free Computer Salary Survey!

Learn about compensation in the computer field, including the effects of inflation and recession, and which career paths offer the greatest compensation from a 28-page report prepared by Source Edp.

Despite past inflation and recession, demand for computer systems and the people needed to support them continues to grow.

But which professionals, with what specialized experience and skills, are really in the best positions for long term career and salary growth? And is your salary really keeping pace?

In our new Survey, you'll get answers to these questions and much more.

Compare your salary with many others.

The new Survey not only provides salary medians for 48 position categories, but it also shows "highs" and "lows" for each one as well. Figures are organized by types of professionals, including those ranging from commercial pro-

grammers to management and marketing positions; by experience level and by size of computer installation site. So you'll be able to compare your salary with those computer professionals who have similar responsibilities and skills and to learn who in computing, in what kinds of specialized disciplines, are earning the most.

No other Survey we know of is more comprehensive. It's based on contacts with more than 50,000 professionals and 25,000 organizations.

Learn about new growth areas.

Most significantly, you'll also read about which specific areas of specialization are forecasted for unusual growth in this decade and beyond. The past year saw many

changes in the economy and has altered career prospects for some professionals who were not properly prepared, so the need to stay abreast of current trends and career planning has never been so critical.

Whatever computer specialty you're in, or plan to explore—programming, software, systems design, data communications, mini/micro systems, data base, computer marketing, sales, management or others—our Survey can help you make the most of your career. You'll be able to keep up with changes in the profession, establish career goals, develop action plans, evaluate your progress, spot potential dangers, take corrective action when needed, and in general, keep your career on the best possible course for growth.

Call for your free copy.

The new 1983 *Computer Salary Survey and Career Planning Guide* is available without charge. You owe it to yourself to get a copy of the report—especially if most of your career lies ahead of you.

Call today and our free 28-page Survey will be mailed to you in strict confidence, without obligation.

Library Catalog, continued...

The remainder of this article is devoted to the technical details of the program and need not be read if you have no desire to do anything but use your computer to keep track of your books. However, before you rush to your keyboard, please read the following few notes of importance.

The program consists of a series of routines that are called from a Catalog Master routine. Additional routines are Catalog Enter, Catalog Search, Catalog Borrow, Catalog Bookshelf, and Catalog List. All of these routines should be stored on a single Catalog Master disk which will also contain files with the catalog classification data and information on bookshelf location and sizes. The length of the routines forces this type of structure. A benefit of this breakdown is the added ease of debugging each routine separately. The book data are stored on separate disks.

A series of ten programs with titles of the form SC PROGRAM 3 is used to create text files with the library classification data needed to derive the specific catalog number for each book. Once these programs have been used to create these files, they can be DELETED from your Catalog Master disk. These ten programs must be run prior to the first use of the Enter routine.

A few words of caution before you start typing. Since the Catalog Master disk is in active use while cataloging it is possible to write over all or part of the routines by accident. LOCK them after they are entered and keep a backup disk. It is also a good idea to run backup disks of your book data disks periodically — just in case.

Program Structure

The structure of the Library Catalog Program is shown schematically in

7 Good reasons why you should subscribe to *Creative Computing*.

It's the Number One magazine of computer applications and software!

There's one place you can always be sure of learning more about microcomputer software and applications: *Creative Computing*.

Every month *Creative Computing* provides you with a continuing education on everything related to microcomputers and computer equipment. Useful articles, "how to" tutorials, exciting new applications, games, and "no holds barred" reviews of the latest software and equipment make up a major part of *Creative Computing's* editorial content.

We give you probing features on programming breakthroughs and important news. Plus in-depth articles on elementary, intermediate and advanced software and applications topics—to help you develop your knowledge and skills, save hundreds (perhaps thousands) of dollars in uneeded software, discover uses for your personal computer that you might never have considered. Articles that increase your overall "computer consciousness." Here's how.

1

Creative Computing gives you things to actually do with a computer.

Just owning a computer isn't enough. You've got to know what to do with it. That's why applications are our primary focus. Text editing, animation, graphics, business simulations, data base and file systems, music synthesis, control of household devices, communications, games—some of the applications and software you'll learn about in *Creative Computing*.

2

Creative Computing discusses business applications in simple, nontechnical language.

If you're a business person who needs to know about the latest developments in word processing and office applications, turn to *Creative Computing*. We clarify such business applications as investment analysis, futures evaluation, data base management, mailing list programs, text editing, word processing and simulations. And all the software available for business people.

3

Creative Computing helps you decide which computer equipment is best for you.

Our tough, no-nonsense equipment profiles arm you with the facts before you walk into a computer store. You'll know the right questions to ask and how to cut through the jargon and sales hype. We give you authoritative guidance in deciding what you need, what you don't need—and what's right for you and your pocketbook.

4

Creative Computing covers computer education in depth.

We started out as a computer education publication, and we're still committed to the educational community. We regularly carry articles on designing educational software, evaluating educational software, teaching concepts and terminology in computer education, text editing applications for literature and computer simulations in the classroom—plus a great deal more.

5

Creative Computing brings you hours of mind-expanding game entertainment.

We've got a soft spot for the computer game addict—and computer game software. We know you want to understand more about the new computer games flooding the market: which ones are easiest to learn? Require the most skill? Offer the most surprises? Give you the best graphics? Provide the most challenge? Contain a new twist? *Creative Computing* brings you the answers.

6

Creative Computing features the state of the art.

Columns on the most popular personal computers, a "software legal forum" letters to the editor. Reviews of books, games, organizations, dealers and events. Fascinating interviews with leading innovators, equipment designers, program developers and game inventors—men and women who'll give you a real glimpse of the future!

7

Our price is right.

By subscribing to *Creative Computing* now, you can save as much as 33% off the full subscription price. To learn elsewhere what you'll learn from *Creative Computing*, you might spend hundreds of dollars in course fees and books. Then you'd have to winnow out what you could use from all that you'd learned. But *Creative Computing* does that for you, so you'll have time to enjoy your own computing interests. And that saving of time makes this offer very inexpensive indeed.

Figure 7. The primary menu is contained in Master, and selection from this menu runs the other routines. Information that needs to be transmitted from one program routine to another is done via POKing the data into memory locations in one routine and PEEKing into these locations to recover it in the next routine.

The catalog classification and bookshelf identification are called as required by the Enter, Search, and Bookshelf routines. When each of the functional routines is exited, Master is run automatically and the primary menu is displayed once again. This type of structure, where only the specific routine that is needed is in memory makes it possible to run on a 48K machine programs that would otherwise require a much larger memory.

Book data are stored in random access files (named LIBREC-120) on disks separate from the Catalog Master disk. Record length for this file

Library Catalog, continued...

is 120 bytes. Information on shelf identification numbers, sizes, and location descriptions is stored on the Catalog Master disk in a sequential text file named SHELF.

What The Routines Do

Catalog Master (Listing 1) is the traffic director for the Library Catalog Program. When the program is run, memory location 770 is examined. If the value stored is anything but 56, a number which I selected randomly, the descriptive information on lines 50 to 260 is presented on the screen. On later occasions, when this routine is called from the other routines in the program, the value 56 will have been POKed into this location and the introduction will not be printed. This random number was selected so that there is only a small probability that the introduction will be skipped if the Catalog program is run after some other program which utilizes this memory location.

The remainder of the routine formulates the menu which is used to call the Enter, Search, and other routines for the actual work. If the decision is made to modify a record, the value 92 is POKed into 773 to tell the Search routine that it is to be used in its modify mode.

When the selection of the desired operation is made, the Catalog Master program goes to the appropriate statement and runs the necessary routine.

Catalog Enter

Catalog Enter (Listing 2) is the routine that requests data on books to be added to the catalog, provides an opportunity to revise the data, checks to make sure that the data are within the expected range, formats the data as required for storage, and prints the data to the disk. For nonfiction books the determination of catalog number for each entry is provided by selection from an ever narrowing listing of subject areas. Provision is made for returning to a broader description of the subject if an error is made in the original selection.

The listing of the catalog descriptors is stored in the array SC\$, which has 1000 elements. During the initial access to the Enter program, this array is filled from ten sequential text files stored on the Catalog Master disk. This read-in process takes about a minute and a half, during which descriptive material is on the screen. Once this data are read in, the Master disk is removed and replaced with the disk to be used for the storage of data.

The data are stored in the file named

LIBREC-120. Details of the file format are given below. The Enter routine opens the file and reads the first record, which contains the number of books currently stored on the disk. If no books are on the disk, the error routine is used to place a zero in the necessary location, and the processing continues. The screen then requests title, author, location, book height (remember, some of my bookshelves are suitable only for small books, and others will accommodate oversize books), and whether the book is fiction or nonfiction.

The title and author are allocated 40 characters each in the data file. The title can contain any characters except the comma or quotation mark. No commas, quotation marks, or spaces are permitted in the author list. Multiple author names are separated with slashes (/), giving the Search program a key to find each name individually.

If the book is fiction, the program jumps to a series of steps that generate the menu for selection of the fiction type, e.g., novel, western, science-fiction, etc. If the book is nonfiction, the primary menu for subject classification is presented, showing the 10 divisions. Upon selection from this menu the appropriate 10 categories for the division are shown, and following selection from this menu, the appropriate 10 subcategories are shown and a selection is made. The routine automatically inserts in the data file the information that the book is not out on loan. The routine also computes the number of authors based on the input. This information is used in the Search routine.

During data entry, each entry you type in is verified to be within the expected range. No protection can be given against spelling errors in the title or author entries, but, for example, the size entry must be either S, N, or T, and the location must be a letter, letter-number sequence for the entry to be accepted. After all necessary data are entered, a listing is presented of the total record, and an opportunity is presented to change incorrect entries. If all are correct, the data are stored in the arrays reserved for them. The operator then has the choice of continuing to add books or to end data entry.

The location of the book must be specified at the time it is entered into the catalog. When the three-character shelf ID is entered, the Enter routine checks that the ID is in the correct format, that the ID has been entered (in the Bookshelf routine) as an existing shelf, and for an inconsistency in

the specified book height and the height of the specified bookshelf. For example, a book of "normal" height cannot be placed on a "short" shelf. If a mismatch occurs during any of the checks the operator is given the choice of reviewing a shelf directory as an aid in correct placement of the book.

After five entries are made, or if the selection has been made to terminate data entry, a subroutine is called to write the stored data to the disk. With 48K memory, there is actually room to store a greater number of records between interruptions for disk storage, but five has been selected to minimize data loss in case of power interruption or other disaster.

After all records are entered, the number of records on the disk, stored in record 0, is increased. If during the writing process the disk becomes full, the drive door is left open after a disk switch, or if the disk has been write protected, an appropriate message is shown and the data are saved. All of the information stored in the computer memory from the books that are to be entered is then written when the drive door is closed or a new disk is inserted.

After the catalog classification data are read into the program, lines 330-390, HIMEM is set to 20000. The reason for this change is given below.

When data entry is completed instructions are given to reinstate the Catalog Master disk in the drive, and the Catalog Master routine is run.

Catalog Search

The Search routine (Listing 3) is the most complex in the program and is used to find books based on any of several keys, and also to modify the

HUNTINGTON COMPUTING

Softlights

By Fred Huntington

Time to let you about a nifty little program that's been around a while that deserves some mention. The Menu Generator is an excellent program that everyone should use on every disk to create a HELLO program to take the typing out of running programs. It creates menus quickly and painlessly. The publisher has even given permission to programmers to use the generated menus in commercial programs — no royalties. Comes complete with a free backup disk. The usual price is \$39.95. Our price **\$33.89**. But until April 30, you can have it for **\$27.99** (#9380).

MONEY TO BURN

If you've got money to burn and want the best monitor for Apple around and do a lot of word processing, you have no choice but The Genius. At only **\$1695** (we'll ship free in U.S.) it includes a special program to make it compatible with Word Star, and your choice of B/W, amber or green screen (only one).

What makes this monitor so special is that it displays a full 57 rows. This means you can see a full page displayed, just like it will be printed. This is unheard of for the Apple. (#113).

ULTIMA II SPECIAL

The hottest new game out is On-Line's Ultima II at \$59.95. Here's a special you won't beat. Buy any item from us, no matter how small, and you can have the Ultima II for only **\$37.99**. This special ends April 30, 1983.

Included in Ultima II is the fanciest packaging ever done by On-Line, a beautiful four-color 17x22 cloth map, suitable for framing, two disks (three sides) and hours of fun. (#1114).

NEW COMPUTER

We're in the process of installing a new Sage computer to run our business. This 16-bit, 68000 computer combined with Flexware software (also available for the Apple) will allow us to have the fastest system ever installed by any mail order business.

In less than the time it takes to type your name, we'll be able to tell you the status of your order, call up any invoice in the last year, tell you shipping cost for any hardware item, when back-ordered items will come in and much more.

We're quite excited about it and will be selling Sage and Flexware and doing custom programming for it. More on this later.

RANA DRIVES

We are now quite competitive on our Rana Drive prices. Give us a call for our new lower prices.

We also have the new Gibson high speed light pen at a discount. This is a knockout item.

At press time our price was \$296. Call for latest pricing. (#114).

Ice Demons is a nice new arcade game from the talented Matthew Jew. Listing at \$29.95, our special this month is **\$22.95**. (#7720).

Omega Microwave has an excellent new game out called A City Dies Whenever Night Falls. List price is \$29.95 and our special is **\$21.95**. The documentation that comes with this is unbelievable. And it is copyable and listable. (#707).

128K — \$399

Also from Omega, we're happy to be carrying their Ramex-128 128K board for only **\$399** (a bargain even at the full list price of \$499). It requires no removing of chips to install. It comes with powerful disk emulation software, which adds eight new DOS commands. It is the only 128K board that allows the user to load or save a full 136K VisiCalc file in 20 seconds. (#708).

Library Catalog, continued...

one author, the search immediately proceeds to look at only books with that or a greater number of authors for a match.

In all cases, if a match is found, the entire record is shown on the screen, and the operator has the opportunity to end the search or to continue the search for additional books by the author or authors.

The search on subject goes through the same process as the entry procedure in that the catalog divisions are shown on the screen and you have the opportunity to select the area of interest. The one change here is that the opportunity is given to search on any of the three levels of categorization. Once the catalog number is selected, the routine jumps to a section which searches each of the data records at byte 82 for a match. The entire record and continue/stop option are presented.

In the modify usage of the Search program, the cataloging data are not read in, and after entry of the title, the search proceeds for the book. When found, the choice of modifying the record, deleting the record, or leaving the record unchanged is presented. If modification is selected, the first choice is to check in/check out the book. If this is the need, the book is either checked in and the shelf location shown, or the borrower's name is requested. These data are then inserted in the book record.

If the record is to be changed, each entry in it is presented individually, with the option of change/no change available each time. Once again, with a modification, you have the opportunity to continue the search for different books with the same title or to end the search.

When a record is selected for deletion, the last record on the disk is rewritten over the record to be deleted.

System Saver™

The most important peripheral for your Apple II.

For Line Surge Suppression

The SYSTEM SAVER provides essential protection to hardware and data from dangerous power surges and data from spikes

By connecting the Apple II power input through the SYSTEM SAVER, power is controlled in two ways: 1) Dangerous voltage spikes are clipped off at a safe 130 Volts RMS/175 Volts dc level. 2) High frequency noise is smoothed out before reaching the Apple II. A PI type filter attenuates common mode noise signals by a minimum of 30 dB from 600 khz to 20 mhz, with a maximum attenuation of 50 dB.

For Cooling

As soon as you move to 64K RAM or 80 columns on your Apple II you need SYSTEM SAVER.

Today's advanced peripheral cards generate more heat. In addition, the cards block any natural air flow through the Apple II creating high temperature conditions that substantially reduce the life of the cards and the computer itself.

SYSTEM SAVER provides correct cooling. An efficient, quiet fan draws fresh air across the mother board, over the power supply and out the side ventilation slots.

For Operating Efficiency

SYSTEM SAVER contains two switched power outlets. As shown in the diagram, the SYSTEM SAVER efficiently organizes your system so that one convenient, front mounted power switch controls SYSTEM SAVER, Apple II, monitor and printer.

The heavy duty switch has a pilot light to alert when system is on. You'll never use the Apple power switch again!

Easy Installation

Just clips on.

and the number of records stored in record zero is decreased by one. A message is printed to the screen when the disk is emptied of catalog data.

HIMEM is changed during the running of this routine, as in the Enter routine, for reasons given below.

Catalog List, Catalog Borrow, And Catalog Bookshelf

Catalog List (Listing 4) is provided for those times when you don't really know what book you want, but would just like to browse through your collection. The only information provided here is the title and author, as the listing is scrolled on the screen.

Catalog Borrow (Listing 5) presents two options. A selection is made by listing either all books out on loan or all books on loan to a given person. The key upon which this search is made is byte 96 of each record. If this byte is 0 the book should be on the shelf, and if it is 1 the book is out on loan.

Catalog Bookshelf (Listing 6) is the first routine that must be run when the Library Catalog program is used for the first time. The Enter routine will not permit a book to be entered on a non-existent shelf.

The menu presented by this routine offers a choice of new shelf entry, shelf removal, directory of all existing shelves, and ending shelf operations. For shelf entry the information required is the shelf ID, the tallest book the shelf can accommodate — in the form S-short, N-normal, T-tall — and a short free-form description of where the shelf is. This description is placed in the directory for later reference. Only the usual commas and quotation marks are prohibited from this statement.

The routine checks for the proper ID format, i.e., Letter Letter Number; existence of a shelf prior to its removal; and duplication of a shelf ID prior to the addition of a new shelf. The routine currently allows 200 shelves, but this can be changed by modifying statement 50. The last operation the Borrow routine does prior to running Master is to alphabetize the shelf ID listing and restore it to the SHELF text file.

Program Particulars Data

The format for the book record file is shown in Table 2. Programmers are encouraged to modify this program to fit the more particular needs of their own library, but care must be taken, such as allowing space in the file for returns and possible variability of data length. As explained above, the program looks for certain data at given

byte locations in the file, and changes will destroy the input.

Increasing Search Speed

In working with strings, one characteristic that the Apple has that can become annoying is the stockpiling of "old" strings after they have been updated. As described on page 53 of the Applesoft manual, if the title variable `TL$= WAR AND PEACE` one time and `GRIMM'S FAIRY TALES` the next, the string `WAR AND PEACE` remains in the attic of memory, and `GRIMM'S` is placed below it.

As dozens of strings with book information are manipulated and compared, the available memory constantly decreases until string storage runs into program and array storage which is working its way up from the basement. Old strings can be cleared away periodically in a program with the statement `X=FRE(0)`, or the machine will do the job itself when the available memory is depleted.

With the large number of strings that the Enter and Search programs require for the catalog classification data (approximately 15K bytes) the housekeeping, which examines all strings in memory, can take almost

two minutes. I found it very disconcerting during a search to listen to the hum of the disk drive looking for the desired book only to have the whole process stop dead while the machine cleaned house.

The solution to this problem is found in the way the Apple treats the strings. String storage starts at `HIMEM` and works down towards the program and array storage area. The Enter and Search routines have been structured so that the 1000 strings of catalog classification data are read in at the beginning of the routines, filling the space below the original setting of `HIMEM`, 38400 (\$9600). Recall that as shown on the memory map in the DOS manual the memory between the top of a 48K machine, 49151 (\$BFFF) and 38400 (\$9600) is lost to DOS use.

After the Enter and Search routines load the catalog classifications, `HIMEM` is set at 20000 (\$4E20), leaving only a few thousand locations available for the new strings that are entered and manipulated. This is ample room, but only requires tenths of a second for the Apple to houseclean when the need arises. Moving `HIMEM` down has eliminated the unnecessary search through the cata-

log classification data strings during each housecleaning. Prior to running the Master program, `HIMEM` is once again set to the original value.

Entering Catalog Classification Data

The heart of the catalog classification routine is the selection process from the 1000 subcategories of the Dewey Decimal System. The information required for this classification is stored in ten subcategory sequential data files, for example, `SC SEQ LIST 3`. These files can be created from the programs shown in Listing 7. The use of a file editor such as `EDASM` in the Applesoft Tool Kit greatly simplifies correction and entering of these files. The subcategory information is written in abbreviated form to reduce memory requirements.

Key Parameters

Table 2 lists the major parameters used in the program. As far as possible the names have been carried through from one routine to another to simplify the debugging process.

Modifying The Program

This program has been structured to enable you to modify easily the input and output to suit your special needs.

Library Catalog, continued...

Subroutines are used extensively for searching, data entry checking, and result presentation, localizing the areas that must be examined if changes are to be made. Space has been left on the book record file so that you may easily add other information that you desire to file, such as publication or

acquisition date for each book.

With the advent of megabyte capacity hard disks for use with personal computers such as the Apple the necessity of using multiple disks for book data storage will disappear. This program will then be suitable for use with much larger libraries.

Acknowledgments

I would like to thank the reference librarians at the Monroeville, PA Public Library for their help in obtaining the listing of the Dewey Decimal System classifications and in teaching me some of the particulars of cataloging books. □

ing two pixels, producing an average rate of one and a half). If you wanted to make the object bounce back to the left, you would subtract DXF from \$00, getting \$80, and DX from \$00, getting (with the borrow from the first subtraction) \$fe. The next DX of \$FE and DXF of \$80 would equal a movement to the left at a rate of one and a half pixels per plot.

The ability to work with fractional motion adds a great deal of control to programs. If you add a value to the fractional portion, you produce acceleration. One object can be made to chase another. If the target is to the right of the object, add something to DXF. If the target is to the left, subtract something from DXF. The amount added or subtracted determines how accurately and quickly one object tracks another. Listing 2 shows some common calculations done with fractional values.

Another handy parameter is a status byte. Not all objects will be treated the same at all times. Something might be disappearing, something else might be appearing, while a third object is undergoing a change such as an explosion. By using a byte as a flag for these conditions, one display loop can handle everything. Let's say you want to remove an object from the screen. The display loop would ordinarily calculate a new location, erase the old position, then draw the new position. But each portion first checks the status byte. If the byte contains a certain value, that portion is skipped. In this example, the status byte would indicate that the drawing portion could be skipped. Thus, the object would be erased but not replotted (the calculation of its new location could also be skipped).

Another independent event that appears simultaneous is sound. Without it, games would be very dull.

Buzz, Click

The Apple has a rather limited sound capability, though you couldn't guess that from the great sound effects produced by some programs. Basically, all that can be produced is a click from the speaker. But by playing with the rate at which the speaker clicks, you can get a wide variety of sounds. The trick is to integrate the sound within a program. If sound is handled as a separate event, everything will stop. This is fine for music on a title page, but not desirable in the middle of a game. Thus, the code for producing sound must work in conjunction with the rest of the program.

For instance, let's say you have a ball bouncing on the screen, and want a sound whenever the ball hits a wall. The wrong way would be to go to a subroutine that produced the whole sound.

The object is to integrate the sound. One way is to find some loop and insert the sound routine there. Most plotting routines occur in a loop. Let's say you add some code to the plotting routine. This code, after putting each byte on the screen, checks a flag. If the flag is set, it strobes the speaker. If not, it skips that code. When the ball bounces, you set the flag. The result will be some sound on every collision. The speaker is strobed at location \$C030. Every access to that location causes a click. A load (such as LDA \$C030) produces one click. A store actually accesses the location twice, thus producing two clicks. By experimenting with speaker strobes in various loops of code, you can produce many sounds, but this is a trial-and-error approach. Another method is to have a

subroutine that is called one or more times during each pass through the program. This routine, using values contained in specific variables and flags, would access the speaker one or more times (depending on values in the variables), or it might skip right to the RTS (again depending on the variables and flags). This subroutine can actually contain a short loop or perhaps ten or twenty iterations without noticeably slowing down a program. By controlling frequency (number of times per second that the event occurs) and volume (number of clicks in each event) your game can come alive with sound. The best way to learn is to experiment.

It's time to take a look at overall program structure, followed by some thoughts on game design.

One Big Loop

Aside from title page and other frills, a game can be thought of as an infinite loop of code. Once the initial conditions have been set, the code just keeps repeating. Some events are skipped, others may happen just once, but the overall structure is one big loop. The key is organizing the units within the loop. As mentioned, the goal is to take individual events and produce the illusion of simultaneity. The more efficient your code, the better the illusion. A rough flow chart can help in setting up the program. It needn't be an immaculate work of art. Just a rough sketch with boxes and arrows is a great help. This will show the logical sequence of events, and make the task of actual coding simpler. Many programs start by reading the controllers, then do the plotting, followed by handling any special actions required by the events on the screen. If you are reading a joystick or two paddles, place the reads at separate areas of the code (if you read two paddles without enough intervening delay, the first

value will affect the second).

Events that happen frequently are usually placed in line. Rare events can be placed in subroutines. There are no concrete rules here. Each program has its own requirements. But you'll find that the common tie throughout all good programs is logical structure. *Sneakers*, *Raster Blaster*, and *Serpentine* contain vastly different code, but if you mapped the structure of these or other games, you'd find elegant, logical organization, breaking a complex whole into simple units. When writing a large program, tackle the work one unit at a time. This is where the flow chart really helps. Each group of blocks with one entry at the top and one exit at the bottom can be thought of as a unit. By programming one unit at a time, and debugging it, you'll end up with a tight, efficient program.

While whole books have been written on the subject of program structure, the best way to learn is to write programs.

Enough probably can and has been said about game design, so I won't dwell

too long on the subject. But I can't resist a few words. Apple games have become very sophisticated. Certain requirements are almost mandatory in any new arcade game that hopes to make it to market. For starters, the graphics must be clean. There is also a trend these days toward cuteness. This may or may not last, but any unique or cute touch in your graphics is probably an advantage, though such things must make sense within the context of the program. All possible controller options should be allowed. If you are using a keyboard, the player should be able to define the keys. For a joystick, the player should be able to switch the X and Y axes (just in case his joystick and yours differ).

Games can't be static. There has to be some increase in difficulty or some new level to reach. In other words, a game must have depth. A game must contain learnable skills. The average player should be able to notice an improvement in his performance—a reward for repeated play.

The best way to assure that your game will be fun is to have others play test it. No programmer can be totally objective about his creation. And by the time you have finished the game, you will be so good at playing it that you won't be able to balance the difficulty fairly. It is not uncommon for a programmer to make his game harder and harder, not realizing that the average player will be blown away by the result. On the other hand, don't assume that no one will top your own performance. Add some levels or difficulty above the point you can reach. It is almost inevitable that someone will be better at the game than you.

Farewell

I could ramble on, but enough has been said here, and one person can't hope to cover everything. Fortunately, there are more and more graphics articles appearing. The word is getting out. I hope I've filled in some of the gaps that existed, and shown that there is no real mystery to Apple graphics.

Before signing off, I want to thank those who, directly or indirectly, had a part in this. First, special thanks to Bob Bishop, both for taking the time to give me a push in the right direction, and for showing all of us, from the start, that there is magic in the Apple. Thanks to Mark Pelczarski for many things. And thanks to all those who shared ideas or answered questions. Such a list, though far from complete, must include Mark Turnell, Dan Thompson, Hunter Hancock, Ernie Brock, Bill Budge, and Frank Covitz. Finally, thanks to all of you who've shown interest in this series and taken the time to send questions and suggestions. It's been fun. □

The Graph Paper

Up to now, we've been covering graphics concepts in a bit of a vacuum, looking at specific areas as independent entities. This month, in what will be the last of the series, we'll be concerned with integrating these concepts into actual games. A lot of what follows falls into the theoretical, and I should stress that none of this is gospel. You should always be on the lookout for new approaches and better techniques.

The Illusion of Simultaneity

Those used to programming in Basic wonder how arcade games can cause so many objects to move at the same time. The answer is that this is an illusion. In the Apple, there are no simultaneous events. Everything happens in sequence. You put a byte on the screen, then another, and so on. Thanks to the speed of machine language, a long series of independent events can appear to happen at the same time. The trick is to organize these events in such a way that this illusion is maintained. If you are animating several objects, they should all be moved with the same section of code. One way to do this is to keep an ordered list of all necessary information for each item.

Let's say your program requires the following information about each object: old X coordinate, old Y coordinate, new X, new Y, X velocity, Y velocity, shape number, and some sort of status byte (more about that later). If these eight parameters are stored sequentially in RAM for each object, all animation can be handled in one loop. The X register can be used to index into the list. The easiest way to do this is to separate each set of entries by some power of 2. In this case, eight is sufficient. If there were

David Lubar

nine or ten items in the list, the separation would be 16 bytes. Suppose, in our example, that the list starts at \$8000. Old X coordinate of the first item would be stored at \$8000, old X for the second item would be at \$8008, the third would be at \$8010, and so on. Now, if a variable is used to keep track of the number of items in the list, and if the separation is a power of 2, the variable can be shifted to provide an index into the list. An example can be found in Listing 1.

The number of items in each entry will be determined by the program. Some programs require only simple parameters. Others can get fairly complex. Let's look at some of these parameters.

Move it

The smallest unit an object can be moved is a single pixel. In simple programs, all locations can be treated as integers. The change in X and Y location (DX and DY) can be held in one byte each. One trick is to exploit the cyclic nature of bytes and always use addition. To move right one pixel, a DX of \$01 is used. When moving left, DX is \$FF (adding \$FF is the same as subtracting \$01). This is simpler than having separate routines for adding or subtracting DX and DY. Also, it makes changes of direction easy to calculate. To make an object bounce, you just subtract DX or DY from \$00. The result becomes the new DX or DY (\$00 - \$01 = \$FF and \$00 - \$FF = \$01). This works for any value of DX and DY.

While integers are fine for simple mo-

tion, they have some limitations. If the change becomes too great, the object jumps rather than moving smoothly. And curved paths are difficult to produce. The answer is to use fractional values. While an object can't be moved a half or fourth of a pixel, this fractional portion can be kept track of. Imagine an object has a DX of one and a DY of one half. Every time it is plotted, it will move one pixel to the right. Every second time, it will move up one pixel. If both DX and DY have a value of one half, the object will move on a diagonal, but at half speed. Such things as gravity and curving paths are easily done using fractional values. I believe this is called "fixed point arithmetic." Whatever, let's take a close look at it.

Each parameter requires two bytes, one for the fraction and one for the integer portion. As before, all calculations can be done with addition. The trick is remembering that the fraction is a binary fraction. So one half would be \$80 (.10000000 in binary), one fourth would be \$40, and so on. As with integer values, direction can be flipped by subtracting the values from \$00. The only constraint is that the subtraction must be treated as a two-byte operation. First the carry is set and the fraction is subtracted from \$00. The result is the new fractional portion. Next, without touching the carry, the integer portion is subtracted from \$00 and the result saved as the new integer portion. For instance (calling the integer portion DX and the fractional portion DXF), suppose DX is \$01 and DXF is \$80. The object would move right at a rate of one and a half pixels per plot (actually, it would alternate between moving one pixel and mov-

Recently, games have started to include speech. It certainly livenes up any program, and the best part about speech is that it is truly easy to do. Listing 1 is a routine that both digitizes and replays voice without any extra hardware. It is less than 128 bytes long.

I think I have succeeded in making a short yet flexible and easy to use program. So please type it in, use it, and enjoy speech in your programs.

How It Is Done

The program digitizes voice through the cassette port on the back of the Apple. You first record the word, sound, or message that you want digitized on a cassette and then play it into the cassette IN port while running the recording routine.

The program checks the status of the signal and records it in memory. Later, when you execute the play routine, the signal stored in memory is output through the internal speaker.

Using Voice In Your Program

This voice routine was designed to be easy for the beginner to use while offering significant power for the ambitious. Therefore, I have included an assembler as well as a Basic listing.

The Basic listing is in the form of data to be POKED in memory to form a machine language program. To use it through Basic, just type in Listing 1, being careful not to make any errors. Once entered, it can be run. The last few lines of the program do a simple sum check for obvious data errors (it is possible that it won't catch all mistakes). If it passes the check sum, Voice Maker should be in memory. Before trying it, save the Basic program, and save the machine language program by typing BSAVE VOICE,AS300,LS84

Now comes the fun part. Record the message you want the Apple to digitize on tape. Actually the cassette recorder you use will make a tremendous dif-

Chris Adams

ference in how the voice sounds. What you need is not the most expensive cassette recorder but a recorder designed for use with a computer. Of the recorders I tested, the Radio Shack CTR-80 produced the best results.

The message should start with a count down such as "3...2...1...0...this is my message." This is so you will know how to start the digitizing process.

Before you can digitize, you must set some pointers in memory for Voice Maker. The pointers indicate where to put the data in memory, how long the recording is to be, and the speed of signal samples. The speed factor is part of a delay loop. The longer the speed factor, the clearer the voice will be at playback but at the expense of memory used for the same length of message.

The speed can be POKED at location 251 and should be in the range of 1 to 20, one being the most accurate.

For initial experimentation, use a speed factor of one. Then when you want to start using several words in a program, use a higher delay such as 10 to spare memory. The memory pointers are stored at 06 and 07. The LSB is POKED at 6 and the MSB at 7. The LSB and MSB are found with this formula:

MSB=INT (ADDRESS/256)

LSB=ADDRESS-(MSB*256)

The next important location is the length marker. The length must be a product of 256 and is derived by adding the number of 256-byte segments to the MSB at location 7. The value derived with this method should be POKED at location 252. The amount of memory used determines the length of the recording.

As a sample, record the message "3...2...1...0...I'm an Apple, what are you?" Put the start of the data at 24576 by POKING memory locations 6 and 7 with the LSB and MSB:

MSB=INT (24576/256) :LSB=24576-(MSB*256)

POKE 6,LSB: POKE 7,MSB

For this example use a speed of one and a length of 4K. That works out to be 16 segments of 256 bytes (each KB has four 256-byte segments). The value POKED to 252 is MSB+16. Since in this case the MSB worked out to be 96, the value used is 96+16=112:

POKE 251,1:REM SPEED

POKE 252,112:REM LENGTH

Hook up the phone of your tape recorder to the cassette IN port in the rear of your Apple. Now as long as the Voice Maker program is properly in memory you can CALL 768. It doesn't matter if the tape has already been positioned to the beginning of the message on the tape.

You can rewind and then play the tape to find the message. The first part of the program will put the signal input through the IN port directly to the built-in speaker without digitizing anything. The actual digitizing process isn't activated until you hit a key on the keyboard.

Until you do, you can adjust the volume and tone until the voice coming from the Apple is as you want it. If the

volume is too low, there won't be any signal at all; if the volume is too high there will be a tremendous amount of static.

Once volume and tone are satisfactory, set up the tape to begin the countdown. Listen until the zero is finished, then hit any key, and the input signal will be digitized until the allotted memory is full. While digitizing, you can't hear what is going on. When the cursor

returns to the screen, the recording process is over, and you can stop the cassette recorder.

To hear the results, just type CALL 874. If all has gone well, you will have a talking Apple. If it didn't work, then there was a mistake either when you entered the data or during the experimental process.

In the future when you want a program to use voice just BLOAD VOICE and set up locations 6 and 7 with the address of the digitized data, put the same value as when you recorded into 251, and 252 should represent the length relative to the position in memory. If you want more than one recording to be used in one program, load them into non-overlapping locations, and whenever you want to use a different one re-POKE the appropriate locations.

To save a word or message, you must know how long it is in terms of bytes, as opposed to where in memory it ends. The length can be found with this formula:

$L = (PEEK(252) - PEEK(7)) * 256$

In this example, the length is 4096 and it starts at 24576 so we can type:

BSAVE MESSAGE #1, A
24576, L 4096

A typical program to use this is shown in Listing 3.

```
10 PRINT CHR$(4); "BLOAD VOICE"
15 PRINT CHR$(4); 1
20 POKE 6,0; POKE 7,64; POKE 251,1;
POKE 252,112
25 CALL 874
30 END
```

When you load the data, as in line 15, it is a good idea to specify where in memory you expect it to go; that is done with the phrase 24576.

If the program in which you use voice also uses strings, it will be necessary to set HIMEM to avoid clobbering your data.

INCREMENT
This is really the heart of the program. As well as incrementing the memory pointer, it sets the masks for the next bit position to be used. If the memory allotted has been exhausted, it pops the stack and ends the current routine.

\$036A to \$0383

PLAY
Starts by calling INIT and then gets a piece of data. If that piece is different from the last, it clicks the speaker. Afterward it does the DELAY and INCREMENT.

The data are stored and retrieved in a strange order. First, all the data are stored in bit 0 of each byte, then the program loops back and puts the data into bit 1. This continues until all bits are full; then the routine ends. Data are retrieved in the same order.

outpost: atari

We will take a bit of a diversion in this edition of the Outpost, to take stock of a promising, yet somehow neglected input device for the Atari computer: the light pen. We will look at the capabilities of such a device, and review a pen available for the Atari as well as other machines. We shall go on to outline steps involved in the construction of an inexpensive but fully functional pen, using readily available parts.

If light pens don't sound to you like a topic that should necessarily elicit heated controversy or a complex and somewhat absurd tale, you are justified, but incorrect. Remember, you own an Atari, so anything is possible. Read on.

In the atmosphere of inspiration that couched the design of the Atari 400/800 computer, foresighted engineers built a great many capabilities directly into the hardware of the machine. Among these was the capability to support a light pen without the need for any additional controller boards. Even today, not too many other machines can make this claim. A light pen can be quite simply plugged into controller port 0, as if it were a paddle or joystick. It can be read straightforwardly with the statements `PEEK(564)` and `PEEK(565)`. And that is all there is to it. That is, from an engineering point of view, you understand.

Those with machines of recent acquisition may not be aware that at one time Atari itself slated a light pen for production. It was to cost less than \$100. In the second quarter of 1981, a products brochure that showed the device in use was released. It was a stubby, fat hunk of plastic with a tip switch on it. And what pretty multicolor pictures it supposedly drew.

Mail-order houses, as they are wont to do, accepted back orders on the Atari pen for some time. Though the decision to kill it was made over a year ago, the

John Anderson

product was listed in a few retail rosters until only a few months ago.

At some point during its short development, a decision was made to pull the pen. The reasons for this remain somewhat vague. Some have suggested that the tip switch was flaky, making the device unreliable.

Another explanation I have heard from more than one reliable source goes like this: The Atari is designed as the machine for *everybody*, including novices and kids. Marketing was skittish about the idea of a tiny kid fooling around a TV tube with a big pointy stick. One false move and gazonga: Mommy finds Billy on the living room floor, a victim of implosion! "Think of the lawsuits," said the legal department. "Pull the pen," said marketing.

Stop laughing. This may or may not have been the last straw concerning the

Atari light pen. Whether it was or not, the pen was pulled from production very swiftly, and it is unlikely the decision will ever be reversed. A few did manage to get off the assembly line, however, and the few people who own them quite properly regard them as collector's items.

Hobbyists like myself, who have read about the capabilities of light pens and know also of the built-in pen capabilities of Atari machines, awaited the appearance of Atari-compatible light pens from other sources. Surprisingly, at least to me, no cheap pen has become available in the ensuing time. It is too bad, really. The peripherals can do a lot to make a microcomputer friendlier.

Just how can they do this? Kind of you to ask. First, let's find out what they do.

Light On The Subject

A light pen, when touched to or aimed closely at a connected monitor or TV screen, will allow the computer to

determine where on that screen the pen is aimed. The driver program may subsequently take that information and do various things with it, but the job of the pen itself is quite simply to make a time measurement, which will be translated into x and y coordinates representative of a position on the CRT.

The capability may seem remarkable, and it is, though a simple explanation of how it works may dispel some of the awe. You may be aware that a TV or raster monitor typically *refreshes* at a rate of 60 frames per second. That is to say the electron gun or guns draw 60 pictures on the screen in one second. But it is impossible to draw an entire picture at once. Rather, the picture is drawn by the *scan line*, starting in the upper left-hand corner, moving to the right. When a line is completed, work begins on the next line. The Atari standard is 192 scan lines per frame. (An excellent explanation of this mechanism was provided by David Small in the June and July 1981 issues of *Creative*.)

Now let's imagine we have a special kind of transistor: one that is sensitive to light. We have hooked this transistor to our Atari, and aimed it at a point on the screen. By noting when a scan goes by and measuring the interval between scan lines or entire screen refreshes, we can get a good idea where the phototransistor is pointed on the video screen. The pen then allows us, through software, to generate x and y vectors corresponding to a point on the screen, which we may then use to draw pictures, make a choice from a menu of alternatives, or answer questions put to us by a program. Figure 1 is a simplified diagram of the process.

As opposed to input via the keyboard or even a paddle or joystick, a light pen can be a dramatically friendly peripheral. Imagine needing merely to point the device at your choice on the screen, in order to make that choice. Or to draw a picture on your CRT as straightforwardly as you might use a crayon on a piece of paper. These are the kinds of possibilities a light pen affords.

By the way, you would have to work extremely hard to push a light pen

through a CRT. It just isn't something you could do without extreme effort, assuming you could do it at all.

Mightier Than The Sword

Soon after the Atari pen bit the dust, a third-party pen for the Atari appeared from Symtec Corporation. This pen is about the most professional you can find for any machine. It is, in fact, an adaptation of the same model used in professional mini and mainframe operations. Its barrel is of heavy, extruded aluminum, with a coiled telephone handset wire leading to an Amphenol connector. It includes a sensitivity trimmer adjustment. Everything about the Symtec pen is top of the line, including the \$150 price tag.

Figure 2 provides an example of the drawing capabilities of the Symtec pen. The software driver I used to create the caricature (portrait) of our fearless leader, Mr. Ahl, appears as Figure 3. In ten lines, the code evidences how elementary a driver can be. This is an obvious benefit of the fact that so much of the work is already done in hardware.

If you wish to endow your Atari with professional light pen capability, the Symtec pen is literally without rival on the market. The pen is also available for the Apple, IBM PC, and VIC-20 ma-

Penlight Light Pen

Of course, many Atari hobbyists will be unable to budget that kind of money for a light pen purchase. I believe the market exists for an inexpensive pen, but no company has yet stepped forward with such a product. Other inexpensive

pens, for machines such as the Apple and TRS-80, can be modified for use with the Atari. I reasoned, however, that it wouldn't entail very much more work to start from scratch. It would also be much cheaper.

The result: for a couple of hours work and about \$10 worth of hardware, you can put a homemade Atari light pen to work with your system. While it will

Home Brew Light Pen.

have neither the accuracy nor the feel of the Symtec pen, it will be perfectly serviceable for many applications, and loads of fun to play with. It is also easy to make. So let's make one!

First, you've got to stock some parts. Get down to the nearest Radio Shack, and pick up the following: one phototransistor, model number 276-130, 89 cents; 1/4 watt 100K ohm resistor, model number 271-045, 19 cents for two; penlight, model number 61-2626, \$1.99.

You will also need a few other pieces of paraphernalia. These include: DE-9 connector plug for the controller port on the Atari, and five-conductor shielded cable (you cannot use an existing Atari joystick, as it lacks necessary pin-outs); a couple of feet of insulated bell or stranded wire; and the plastic top to a Bic pen. You may also want a grommet or strain relief for the pen top.

For tools, you'll need this array: low wattage soldering iron and solder; wire cutters (needleless pliers are handy too); X-acto or razor knife; scissors or reamer; small flat blade and Phillips screwdrivers; long stick pin or safety pin; and insulating electrical tape.

Got these things together? Let's get going. First, unscrew the cap on the penlight, and disassemble the light bulb and bayonet assembly from the white plastic pen tip. Next, gently press the switch assembly down through the barrel of the pen with the Phillips screwdriver. We don't want a penlight anymore, and we need all the real estate inside it in order to convert.

The cable we connect will feed through the hole where the on/off switch used to reside. You will pop the switch out through the open side of the barrel, along with two springs and a

MEET THE WIZARD OF WALL STREET

Standard & Poor's STOCKPAK system can turn any investor into a whiz

Whether you're an active investor, or just considering the best ways to invest, STOCKPAK can turn you into a Wall Street Wizard.

Sophisticated software that's easy to use

STOCKPAK is a sophisticated software system that offers you an easy and economical way to obtain and evaluate important investment information to help you make better investment decisions. In fact, in virtually no time at all, you can put STOCKPAK to work for you performing a wide range of investment functions.

Screening power is at your command

Our Screen and Select system lets you apply your own investment criteria to a 900-company database. For example, you can tell STOCKPAK to find only large companies, or only small ones... only those with high earnings growth, or low P/E's, or high dividends... only those in certain industries, or on specific exchanges... only those above or below a certain price... or only those with high sales, or low debt, and so on.

In fact, you can draw from over 200 specific information items to compose a single screen. And, you can establish your own targets and cut-off points in each of these 200 areas. STOCKPAK will oblige by searching through the entire database to find only those companies that satisfy your criteria.

More feats of wizardry with STOCKPAK

Standard & Poor's time-tested software also lets you evaluate and manage actual or hypothetical portfolios of up to 100 stocks each. And, you can create your own customized reports—displayed the way you want them.

Whether you use STOCKPAK to help improve your investment decisions, or just for the fun of it, it's good to know the source of this wizardry: Standard & Poor's, one of the world's leading financial publishers with a 120-year reputation of service to the investment community.

Visit your local Radio Shack Computer Store today

STOCKPAK is designed exclusively for use on the TRS-80 Models III and I computers with 32K business systems and two disk drives. Using a closed pair of scissors or a reamer, enlarge the switch hole on the metal barrel top until it accommodates the wire, grommet, or strain relief on the connector wire you have chosen. When this is accomplished, push the pen barrel

up from the threaded side, as indicated in Figure 5. Run the blade around the plastic tip repeatedly, until a rudimentary trench begins to appear. Once it does, use the flat blade screwdriver to widen and deepen the groove. This groove will hold the touch ring, which we shall use as the switch on our pen, in place.

Next, using the stick pin or an open safety pin, you will put a hole in the groove. Place the end of the pin in the groove, then put the tip of the soldering iron on the pin. Grasp the pin with the pliers or far enough back to avoid burning yourself. The plastic will melt only around the pin, and you'll have a clean hole through the pen cap. Work the hole out to about the diameter of a pencil lead. The touch ring wire will have to fit out and back into the pen through this hole. Figure 6 will help you gain a clear idea of what you're trying to do.

onto the wire (it would be embarrassing to construct the entire pen, then discover you left the barrel aside, and have to disassemble all your work to fit it on).

Take the phototransistor, and hold it so that the bottom is facing you. Turn it until it is oriented along the lines of the diagram presented as Figure 4. This will indicate the positions of collector, base, and emitter leads of the component. You can clip the base lead short, as we will not be making use of it.

Solder directly to the collector lead one 100K resistor, along with a plain lead about four or five inches long, as indicated in Figure 4. Solder another lead of about the same length to the emitter lead, also as indicated. Don't use a high wattage iron or apply heat for too long, as you run the risk of blowing the transistor.

Using the X-acto knife, cut all the way around the plastic tip of the pen light, at a distance of about $\frac{1}{8}$ of an inch

construction of the touch ring. Strip a five inch or so length of wire entirely. If it is stranded as opposed to solid wire, make sure that you have twisted it together thoroughly, or it will unravel while you are threading it into the pen tip. The wire will loop all the way around the pen tip, into the groove hole, and should be tightly twisted to itself on the inside.

Figure 8.

We are now ready to wire up the pen. Figure 8 provides a wiring diagram for connection to controller port 0. We shall be using the analog reading of Paddle (0) to tell us whether the touch ring is open or closed. The ground, pin 8, and the Paddle (0) hot lead, pin 9, form the touch ring circuit. As it turns out, this is an extremely convenient manner in which to activate and deactivate the pen. The resistor is connected between the collector and +5 volts, which is pin 7. The collector is also connected directly to pin 6, which is the hot pen lead. The emitter attaches to ground, which as stated, is pin 8 on the controller plug.

After the connectors have been soldered together with their respective leads, a test of the pen is in order, to make sure everything will be working when it is assembled. Plug the pen in, boot Atari Basic, and type the following:

```
10 SETCOLOR 2,0,14:SETCOLOR
1,0,0: ?
PEEK (564) . PEEK (565) .
PADDLE (0) : GOTO 10
```

Upon running the program, hold the phototransistor up to different points on the screen, and ascertain that you are getting different readings for each position. Don't worry yet whether the readings are perfectly reasonable. Just make sure they change when the pen position changes. If they don't, you probably made a wiring mistake somewhere.

When you touch the leads coming from pins 8 and 9 together, the last value printed in the program loop should move well down from its default, 228. If you are getting different PEEK values and paddle values, all is well, and you are in the home stretch.

Using the insulating tape, wrap up the pen wiring assembly so that nothing will short out when it is squeezed into the pen barrel. There is plenty of room in the pen for the assembly, so you shouldn't have to force anything.

Next solder two four- or five-inch insulated leads to connectors 8 and 9, which will detect our touch ring. One of these leads will connect directly to the tail of the touch ring, and the other will ground to the exterior barrel of the pen. This is easily effected by wrapping a generous length of stripped lead through the square hole in the plastic tip, as indicated in Figure 9. Then, when the plastic tip is screwed on, a good ground connection will be made via friction fit.

It is imperative that the connection to the touch ring itself be well insulated—your electrical tape will come in handy again here. Make sure no bare wire is left to accidentally short the switch. That way it will only close when your finger shorts it.

We're almost done. Bet you have been

wondering what our Bic pen top is for. Well, now we need it. Cut off the tip and the bottom with the X-acto knife, as shown in Figure 10, so just about a half inch from near the top is left. This remaining collar will act as a guide for the phototransistor in the pen tip. Press it into the plastic tip, tapered side first, as shown.

After making a final inspection to ensure all bare wire has been insulated, push the wiring assembly into the barrel of the pen, leaving just the phototransistor peeking out about a half inch, and of course the switch leads and tip. Carefully screw on the tip, making sure that the phototransistor is seated well in the pen collar, and that a satisfactory ground connection is being made between the lead looped outside the plastic cap and the barrel of the pen. And that's it.

Conduct another test, identical to the earlier one. If results are unsatisfactory, you'll have to undo things and find out where you went wrong. If you are having trouble activating the touch ring, try

wetting your finger before you dismantle anything. Because we are reading the resistance between the ring and the barrel of the pen, a dry finger can sometimes be the culprit.

You should now have a relatively neat looking as well as functional light pen, that passes the one-line software test with flying colors. The time has come to begin refining that software dramatically.

I will provide two starting points. Figure 11 is a drawing program, which will give you an idea of how good (or bad) the pen is at locating itself. I built three pens, and the calibration seemed pretty consistent among them. Of course your monitor will have much to do with pen calibration.

The first place to look is line 70. Values in this line should be altered until the plot occurs right underneath the pen tip. If the left side of the screen reads okay but the right half is out, you may have to fiddle with the value in line 50. Don't get nervous. For most folks, the values shown in the program will be pretty close to perfect.

You will quickly see that the pen is much more accurate at vertical measurement than at horizontal. This is probably its biggest shortcoming, though it has others. For one, the screen must be

extremely bright to get a good reading. For this reason I have included an option to reverse color, which is chosen by pointing the pen to the text window and touching the ring. To erase, move the pen below the bottom edge of the text window.

Figure 12 is a simple menu selection program to give you an idea of the convenience of a light pen for varied information input. The pen you have built is more than accurate enough to

support a function such as this. The squares in the listing are obtained by pressing the Atari key, followed by a space.

Needless to say, these examples are presented just to get you started. Your imagination can take it from here. So there you have it. You need never be stymied again when people ask you about the light pen capabilities of the Atari machine. In fact, they may be sorry they asked! □

A year's worth of columns has generated a steady flow of mail much, I think, to the postman's chagrin. The letters vary, of course. About half are just chit chat, or a listing of a favorite program, or a clever(?) one-liner. The rest are questions, most of which do come with a return envelope. I have received letters from all of the countries in Western Europe and Great Britain; from Egypt, Israel, and Saudi Arabia; from South Africa; from Canada; and from Chile, Venezuela, Argentina, and Brazil. The international respondents are usually apologetic about not sending a stamp, but they send coin quite often. Josh's collection, begun modestly as a result of my own infrequent travels, is growing.

Two questions are asked frequently. This column is about those two questions. One I can dispose of quickly, but the other consumes the bulk of this column and, depending on my mood during the holidays, may chew up some of next month's as well. First, the easy one.

The CompuCable Friction Feed Kit

Of all the products I have mentioned, none has aroused more interest than this one. It is a kit of parts that converts an Epson MX-80 printer (or IBM 80 CPS printer) from a tractor-driven, continuous-forms printer to one that can take cut sheets.

W. H. Fastie, 7110 Sheffield Road, Baltimore, MD 21212.

Will Fastie

The first half of the question is "Who is the manufacturer and where are they?" Answer: They are CompuCable Corporation, and they are located at 1440 South State College Blvd., Suite 6-J, Anaheim, CA 92806. The phone number is (714) 635-7330.

The other half of the question is "How are you doing with yours, and do you still like it?" Answer: Just fine, thanks, and I do still like it. For a variety of reasons, I would prefer an Epson MX-80 F/T instead, but I think the CompuCable kit is a reasonable alternative for those of us who bought either the IBM or a pre-F/T Epson. I would like to be able to adjust the tractors for other paper widths, but I haven't really had the need.

I find single sheets a little difficult to feed. Practice is required until you get the hang of it. Envelopes do not exactly fit, since they are wider than the platen and thus overlap the pinwheels. To do envelopes, I have a special addressing program (see Listing 1). I insert the envelope, type in all the lines of the address, correct them if necessary, and initiate the print. The program then delays for several seconds so I can put extra pressure on the rollers. It is awkward, but again, infrequent.

The only problem I will report has nothing to do with cut sheets. The modified printer has a slight tendency to wrap

continuous paper around the platen. This contingency is provided for in the design of the kit, but it happens once every hundred pages anyway. The problem appears to be that the kit is less effective at lifting the sprocket holes off the tractor pins than the original Epson equipment.

I still do recommend this product. It certainly has been worth having, and the minor inconveniences are far outweighed by the function for which it was intended.

Getting At BIOS, et. al.

The hard question I am regularly asked is how system functions can be accessed from the higher level languages. The majority of writers ask about IBM Pascal, which unfortunately does not provide access to many of the functions that even Basic supports well. For example, there is no Pascal analog for the Basic statement CLS, which clears the screen. There is no way to make specific IBM DOS calls, or to gain access to the ROM BIOS.

Even with Basic, there are still features that cannot be had, and I have been asked about interfacing both Basic and Compiled Basic to the system. This month I will show you how to do it with Pascal, and at some later time we will take up Basic.

How The System Works

To understand the programs I am presenting this month, you must understand something about the way the PC works. Here is a nutshell explanation.

The PC is delivered with some programs in permanent memory, usually referred to as "read-only memory" or ROM. The ROM contains three sections of code: Cassette Basic, diagnostics, and the "basic input/output system" or BIOS. The BIOS is very important, because it provides the basic services that make the PC run. For example, it contains the program that decodes the keyboard and translates keyboard speak into ASCII characters. More to the point for my readers, it contains a large chunk of code to manage the video displays, both monochrome and graphic. Access to these routines is achieved through the use of interrupts.

Usually we think of an interrupt as something caused by an external event—for example, the depression of a key on the keyboard. The IBM PC (using Intel parts) allows the processor to ignore quiescent devices most of the time, attending to them only when they raise their hands and yell for help. The yell is the interrupt, which causes the CPU to stop what it was doing and transfer control to a program that knows what to do with that particular kind of interrupt. When that program is done, the processing of the original program can resume.

The 8088 includes an interrupt instruction (INT) which has precisely the same effect. In fact, the instruction can be used to simulate the behavior of a device even if the device is not present in the system. When used in a program, the instruction is similar in behavior to the more familiar subroutine call. Except for one thing.

The INT instruction requires that a single specific location in memory contain the address of the routine to which control is to be transferred. A table of addresses, one for each of the 256 interrupts supported by the processor, is maintained in RAM memory at absolute locations 00000H to 003FFH. The CALL instruction, in contrast, allows its address to be virtually anywhere, imposing no restrictions.

But so what? Why does this facility bring so much power to a program? In general, it does not. However, it is especially useful for operating systems and is extremely valuable when some of the programs to be called reside in ROM.

Consider this. Suppose IBM found a critical bug in the video driver code in the ROM BIOS. Straight away they fix it and start delivering machines with new versions of the ROM. But what about you and me? Because the video code is accessed through an interrupt, IBM could supply a program that would modify the contents of the position of that interrupt in the table to point instead to the fixed version in normal (RAM) memory. In fact, that is exactly what happened with

the Basic bug. Cassette Basic also had the bug, which meant the bad code was in ROM. IBM distributed a new disk version of Basic which did not have the bug. How? By plunking a repaired version of the code in main memory and adjusting the interrupt table to point to it.

As it happens, all the fundamental capabilities of the PC are accessed through the interrupt system, including calls to IBM DOS and execution of Basic statements. So if you are trying to do something outside the scope of the programming language with which you are working, you need to be able to issue an interrupt, something that is not quite as simple as it sounds unless your language is assembly.

PSYSINT Is Born

What we need is a routine that can be called from Pascal to invoke an interrupt service routine. Pascal must provide the information which normally is placed in the CPU registers, and the routine must get that information into the proper registers. Since some interrupts will return information, the routine must provide a mechanism to pass data back to the caller.

Rather than write such a routine from scratch, I decided to adapt (with permission) the routine SYSINT from George Eberhardt's C86 Compiler for the PC. I have modified it primarily for clarity, although I have made it slightly less functional as well. The Pascal version of

IBM Images, continued...

SYNINT, or PSYSINT, is shown in Listing 2.

Let's take a look at this and see just what it does. The first three instructions (lines 44 to 46) are required for the Pascal environment, and make some adjustments to the stack and frame pointers. The program then uses a "trick" to get the current instruction pointer location by calling a subroutine at the next location. This transfers control to the next location after pushing a return address (DUMMY) onto the stack. This address is immediately used to calculate the location of the INT instruction on line 58. The desired interrupt number is retrieved from the parameter list of the subroutine and inserted in the instruction.

I apologize for this technique. I should not write code like this, but it is considerably more obvious than George's perfect simulation of the INT instruction (see box). In general, self-modifying code is something to be avoided.

Once the INT is set, the register values must be inserted into their proper registers. This is accomplished by the REGSIN routine, which PUSHes all the passed values onto the stack and then POPs them into their proper registers. Then the interrupt instruction is executed, and the requested service is obtained.

When the service routine is done, control is transferred back to the location following the INT instruction, at which point the process described above is reversed. The routine REGSOUT gets the values in each register and puts them in the record passed as an argument to PSYSINT.

Using PSYSINT

Great. Now we have this nifty routine, but how do we get at it from Pascal? That's what Listing 3 is all about. It contains three interface routines (CLS, LOCATE, and CHROUT) which demonstrate how to write Pascal for PSYSINT. There is also a short main program which tries the new features.

The first thing we must do is define a new record type for the registers. This version of PSYSINT supports only the four general purpose registers AX, BX, CX, and DX, but the type REGSET (for register set) also includes the low and high portions of each since many BIOS routines expect values in a half-register. You should notice a peculiar feature about this record: the low half of the register is declared before the high half. This is because the record must exactly match the memory configuration of the register set: the 8088 stores 16-bit values with their two 8-bit halves switched.

EXAMPLE then declares two register sets, SREG and RREG. We will use SREG to hold the register values needed

to invoke a function, while RREG will hold any information returned from the routine. (A single register set would also serve if the original values were not needed after the call.) I also have described another WORD, called FLAGS. PSYSINT returns as its value all the processor flags, and we need a place to put them. Finally, PSYSINT is declared to the compiler, showing its three parameters and their types (again mentioning

REGSET), the type of the return value, and the fact that the routine is external to this program, that is, not defined within this source file.

The three routines are self-explanatory if you have the IBM Technical Reference manual. All the calling sequences are documented in the ROM BIOS listing at the end of the book. A few comments are in order, however. First, CLS always assumes that the monochrome display in

80 x 25 mode is the display mode, and therefore the value 2 goes in AL. The right way to do this is to find out what mode is currently active and pass that value. The procedure would then be completely general. The mode is stored in absolute location 00449H (or segment 40H, offset 49H, if you prefer) so it can be obtained by CLS if desired. In Pascal the ADR OF, ADS OF, and pointer constructs can be used to accomplish this, avoiding further assembly language.

Second, the routine CHROUT always writes the character to the video display with the white-on-black attribute. There is a call to the BIOS to write the character without changing the existing attribute, but I have been having some trouble with that one, and I didn't have the time this month to deal with it. CHROUT could be modified to include a parameter for the attribute character.

Finally, I have been cavalier in my use of "magic numbers." We refer to constants like 200, 210, and 20 as magic numbers because there is nothing in the program to indicate what their values mean. In this case, the range 200 to 210 represents 11 graphics characters, chosen to show the purpose for CHROUT.

These examples should serve to demonstrate how PSYSINT can be used to build a library of system interface routines to meet almost any need. PSYSINT should serve you well, provided ultimate speed is not a requirement, as the routine does impose a small additional overhead upon BIOS, already burdened with considerable overhead itself. And one final note: PSYSINT is not suitable for multi-task or -program environments, because it is self-modifying and because it does not preserve the entire set of registers across the interrupt call. It must be modified to perform a complete simulation of the interrupt and to protect itself from reentrancy problems.

The Development Process

This is not the first time I have used the tools needed to build these programs. However, I got lost briefly in the development process (I didn't order the half-register pairs in the REGSET type properly at first) and I therefore spent considerably more time with the tools than I cared to. Here is a brief report.

I should first compliment IBM and Microsoft on the consistency of operation of all the language compilers, as well as the linker. These programs all behave in the same way, making it relatively easy to move back and forth between Pascal and the Macro Assembler, for instance. Once you have used one, you have used them all. The only difference is the various options which are specific to each language.

Pascal runs pretty well. Its problem is its size, which makes it necessary to switch disks to get at various pieces of the compiler. This gets old fast. I'll get some relief next week when my 320K disk drives arrive, because I'll be able to combine the two passes of the compiler on a single disk. That will simplify things considerably.

The Pascal manual is generally complete. The description of the procedure and function calling convention, the very thing I needed to understand to write PSYSINT, is terrible. There are a few paragraphs giving some information, and then there is a poorly contrived example.

How To Simulate An INT Instruction

If you are going to simulate it, first you must know how it works.

The following things happen (in the hardware) when the INT instruction is executed.

1. The CPU flags are pushed onto the stack.
2. The IF and TF flags are cleared (set to zero).
3. The CS (code segment) register is pushed onto the stack.
4. The memory location associated with the interrupt number in the instruction is computed. It contains the segment address and the segment offset of the interrupt routine.
5. The segment address is loaded into the CS register.
6. The PC is pushed onto the stack.
7. The segment offset is loaded into the PC register, which effects the transfer of control to the interrupt routine.

PSYSINT

Here is the assembly language code needed to make this happen. The numbers in parentheses in the comments identify which of the steps above is being handled. It should be obvious where this fits in PSYSINT.ASM.

This code can only be understood in the context of the IRET instruction. The routine first sets up the stack as if the INT instruction had been executed. However, this is not enough to cause the transfer of control. It turns out that IRET does precisely steps 2, 5, and 7 by taking the values from the stack. In other words, IRET is the inverse of INT in that it undoes what INT does. Therefore, the routine above "tricks" IRET into performing what it thinks is a normal return from interrupt, but which in fact has been set up to transfer control to the routine.

Although tricky, the routine is a perfect simulation of the INT instruction, and is also suitable for use in multi-programming environments, since it is re-entrant. For Pascal, the routine is proper. For other languages, it might be necessary to save additional registers, such as ES, DS, SI, or DI.

IBM images, continued...

There is a tremendous amount of information missing from this section, information which is actually scattered around the book. Worse, the index doesn't have entries that match my terminology for the information for which I was searching. The combination of the manual and some experiments finally taught me what I needed to know, but it took much too long.

The Macro Assembler is okay. I wish the defaults for page length and line width were rational, though. Why is it that so many programs don't allow for top and bottom margins, or a binding margin on the left? A line width of 80 is crazy considering how much space the assembler puts on the left side of each line. Well, it can be fixed as you can see.

The linker seems well-behaved enough. I had a documentation problem again, trying to relate the addresses on the map with the actual load addresses in memory. I was using the linker information in the Pascal manual for a while with no luck. I switched to the DOS manual, and finally found the one sentence that got me off the hook. The reason that map addresses don't match memory addresses has to do with the structure of a .EXE file, the type of executable file produced by LINK. .EXE files are relocated into memory when they are loaded, so the actual memory locations are not known at link time. Unfortunately, there is no tool to help with calculating the correct address from the offset given in the map: it is a manual process. The fact eluding me was the method of calculation.

The final tool, and by far the worst, is DEBUG, the IBM DOS debugger. The program is no help at all for any serious work. The most glaring deficiency is the lack of an assembler so that program changes can be made with source language statements. DEBUG does not handle expressions and does not display data in number systems other than hex. It is not a symbolic debugger, so it does not know anything by name. For example, it is not possible to set a breakpoint at PSYSINT: the absolute address of PSYSINT must be known. Breakpoints are not handled well at all, to the extent that if none are encountered and the program terminates, the breakpoints are left in place. If the debugger knows the program terminated normally, why can't it remove breakpoints? It certainly must know where they are. There are other problems as well.

In summary, the documentation, although complete, seriously complicated my work and caused me to spend much more time than I usually allot for a column. Otherwise the task was straightforward. A serious debugger is much needed.

BIOS Overhead and Video Displays

I mentioned above that the BIOS has a fair amount of overhead. This is both good news and bad news. Let me take a moment to explain my position.

BIOS is written quite conservatively. It appears that little is left to chance, the authors preferring to err on the side of caution. For example, most routines preserve the caller's copy of many registers, more than necessary in some cases. However, doing so isolates a routine and significantly reduces the chance of an error inside one routine doing damage outside its scope. For a piece of software intended for permanency in ROM at the end of a 13-month development project, such conservatism is admirable. Although problems have been found over the last year or so, there has been nothing so severe as to prevent an application from successful

implementation. IBM deserves credit for this, especially because of the volume and complexity of code in the BIOS.

The bad news is that the conservatism does tend to create execution overhead, no place more evident than in the video output section. The problem is so severe that use of the BIOS routines for display output cannot keep up with a communications line operating at 9600 bps. Actually, the problem is more a design mistake, forcing the use of routines not well suited for the purpose.

A case in point: the video section provides routines to output a single character, or a single character multiple times. It does not provide a routine to output a string of different characters, obviously a frequent activity. To make this happen, a program must call the BIOS once for each character in the string.

The video section is very general. It is possible to call for video output while in any display mode; the program makes all the necessary determinations and acts accordingly. But at what price? Frankly, it is expensive. Sure, all the decisions that have to be made happen in a flash, but how many flashes make up a second? Worse, the display adapter cards behave in a peculiar way that requires the software to wait for certain instants before inserting the character into the memory of the display adapter. Once the instant arrives, there is time to insert several characters, but by BIOS design there is never more than one.

The net result of all this is some surprising slowness from the video section of the BIOS. It is possible to see the difference by ignoring the BIOS and just writing the characters to the display adapter memory. Programs written like that are visually fast, and it is possible to make display pages "snap" in and out. This technique happens to work on the monochrome display, but it creates snow on the color/graphics adapter.

Is there a solution? For the ambitious software developer, yes. Because the routines are all accessed through interrupts (and you thought this part of the column

My Favorite Word Processor

Satellite Software finally came through, and I now have a copy of *WordPerfect*, a terrific word processing program. You might remember that I have mentioned this product before, in passing, although I said I had to reserve judgment until I had seen the result of the conversion of the software from Data General to the PC. I shouldn't have worried. As Pete Peterson, the VP of marketing at SSI told me, "Will, it'll be like coming home."

He was alluding to the fact that I use *WordPerfect* on DG gear every day at work. He was right. I did feel right at home. Although function key placement is a little different, I found the new positions relatively easy to get used to.

I was worried that SSI would not make a complete transition from their previous market niche in medium to large systems to the considerably more difficult market arena of the small, personal system. I was primarily concerned about how printers would be handled, because this is the one thing that you can expect to be different from system to system. The success of *WordStar* is due in large part to its ability to configure for almost any imaginable system. Well, not only does *WordPerfect* support a wide range of printers, it also handles two at a time, prints in the background, and can maintain a queue of print requests rather than just one. Both the parallel and serial ports are supported. Furthermore, printer control codes can be embedded in the text at any position to get at features not directly supported by *WordPerfect*.

The two major print enhancements, bold and underscore, are directly supported by the system. They show up on the screen, and they can be done on virtually any printer. *WordPerfect* goes one step further for the Epson printer, something I really like: for those equipped with Grafrax, italics can be

printed just by selecting a different built-in font.

I like this package so much that I may come to regret my prime directive of word processor evaluation: use the evaluation product for one major piece of work before reviewing it. That means I won't be able to use *WordPerfect* all the time. Rats. Not to worry, though. I'll still retain my objectivity. But I do get to have a favorite, don't I?

Well, to be honest, there are a couple of disappointments. The first is that SSI's super help feature on DG is not carried over to the PC implementation. For DG, you press the help key followed by another keystroke. *WordPerfect* then tells you what you need to know about the function of that key. For the PC, the help key gets you an alphabetical list of the functions, the key to press to obtain the function, and the page number in the manual that describes the function. It's not too bad, but it's also not as powerful or as helpful as the original. SSI told me that space limitations were the culprit, but coming from them I was surprised to hear it. For DG, their stock in trade has been their ability to deliver a full-function word processor in a very limited amount of space.

The other disappointment is that the program requires a little more than 64K of main memory. SSI says they are working on making it fit. Again, they are well known for their compact implementations for DG. I don't expect this to be a problem because the majority of machines sold to businesses have more than 64K of main memory, and expanding to be able to use this software is hardly a painful thing to do. It might restrict consumers at the low end, however.

The program costs \$495 and includes the SSI merge feature, a complex but useful math mode, and an easy-to-use column feature. A dictionary option will be available soon at additional cost—around \$100 I think.

The old Forty-Niner dipped his Tandy pan into the Texas creekbed and came up with flecks of gold: a TRS-80 sculpture, Radio Shack's *Audio Spectrum Analyzer* plug-in program for the Color Computer, a book on TRS-80 graphics, Tandyvision One, a comment on Color-Computer hi-res, and a short program that draws a four-way doodle under your control.

TRS-80 Computer Sculpture

For \$9.95 you can buy, postpaid, a paperweight and/or conversation piece that is, according to the press release, "a contemporary caricature of the popular

Figure 1. One of the half-dozen computer sculptures offered by Brian Productions resembles the Radio Shack TRS-80 Model III.

Stephen B. Gray

TRS-80 and a happy user" (Figure 1).

This sculpture of a Model III and a computernik with no neck and not much torso (for \$9.95 you were expecting Michaelangelo?) is an "antique gold-finished plaster statue... a hefty 4 1/2 inches long." Ten or more are \$7.95 each, from Brian Productions, 2949 Southfield Rd., Xenia, OH 45385.

Brian told me the sculpture is plaster of paris (so don't drop it), which he has cast commercially in quantity and then sprays black and gold himself. He's been selling such sculptures for ten years, starting with an NCR Century. He also sells similar sculptures of the Apple, IBM System/3, IBM 370, a plain unnamed computer (which looks somewhat like an old IBM 360), and another labelled, "I hate my computer," which resembles nothing at all.

Audio Spectrum Analyzer

Although Radio Shack's \$19.95 plug-in *Audio Spectrum Analyzer* Program Pak for the Color Computer is described in the catalog as "the perfect way to test your stereo equipment for maximum performance," it's quite entertaining just to watch the vertical bars dancing like a colorful fountain in response to the music.

First you connect your stereo amplifier to the Color Computer by patching the headphone output of the

amplifier to the black plug on the cassette recorder that normally goes into the EAR jack, using a connector that has a quarter-inch stereo jack on one end and an eighth-inch miniplug on the other. With the other end of the cable plugged into the computer, and the program ROM cartridge inserted in the right-side slot, all you do is turn on the stereo and the computer, and soon you see a very colorful display (Figure 2) of 27 vertical bars that represent one-third-octave segments of the nine-octave range from 31.5 Hz to 12,500 Hz.

The vertical color bars are calibrated in dB, which is a relative measurement; the program locks onto the loudest one-third-octave present and scales its measurements from that reference.

As you watch, you learn about the characteristics of various types of music,

Figure 2. The energy distribution of music or speech is displayed as vertical color bars a third of an octave apart.

MICROTERM... A SOUND HEARD ROUND THE WORLD, ...IN SECONDS.

MICROTERM

The expanding horizon of office and home use of new communications and data services tying smart terminals into networks through telecommunications links makes the world need a high speed terminal program.

Busy computers shouldn't have to wait for data simply because an old fashioned link can't handle today and tomorrow's telecommunications. Slow terminal telecommunications can stand the smart operator's world on its ear.

Into today's fast paced world, Micro Systems Software presents MicroTerm, the first truly high speed terminal for this inquisitive world. Some computers can run at up to 4800 baud null-free (9600 in some direct-connect applications).

MicroTerm enables you to do more in less time, in both ASCII and the new "error-free" direct file mode. Its unique Macro-Key function allows you to have 10 user-defined keys that transmit up to 64 characters at a single stroke. You can even dial a phone number and transmit the buffer at a specified time completely unattended by the operator.

And while MicroTerm improves your computer's "ears" by outperforming any other telecommunica-

tions terminal program, its low price won't take a bite from your bit budget. It's only \$79.95 retail.

You can't lose with MicroTerm's features, performance, price, documentation, or support.

It's the only terminal program enabling you to continue operations in the command mode while receiving additional data through the RS232 cable. And you can adjust video width, turn on the printer, open the buffer and do many other things and then return to the terminal mode without missing a thing.

Available for the TRS-80 Models I, II, III, 16, IBM PC, Zenith Z-100, and Apple II computers.

and before long you might even be able to identify with the sound turned off classical music, rock, and jazz. Press the K key, and you get an "audio kaleidoscope" that produces changing visual images that depend on the distribution and intensity of the audio signal. At first the pattern seems truly random, but after a while, you learn to differentiate between various types of music. Even noise has its own pattern.

The color bars that represent the instantaneous energy distribution display the real-time peak response. Press S to get the averaging Slow RMS response, for measuring the effect of speaker placement or tone adjustments.

Measuring power is difficult, because the peaks pass quickly. You can lock onto the highest peak level reached in each band by pressing P to show the Peak levels in the signal. In Fast mode, you see which frequencies demand the most power; in Slow mode, the average distribution of the signal and the general relative response of the system under test.

To freeze the display for analyzing a musical passage or an instant in time, just press the space bar.

Measuring the Electronics

Put a familiar record on your turntable, set the tone-altering controls to flat response, set *Spectrum Analyzer* to Slow response with the Peak display turned off, and play the entire selection. Adjust the amplifier volume to show maximum activity on the screen.

Then replay, in Peak Hold mode. At the end of the selection, the Peak indicators show the maximum average energy reached in each band. You can now play the record again and use your tone controls or graphic equalizer to change the sound, and see their effects on the music by comparing the new peaks to the original peak indicators.

Measuring the Audio Chain

By connecting *Spectrum Analyzer* to a low-powered amplifier driven by a microphone, you can measure room and speaker response. Try the microphone in various parts of the room, and use your tone controls and/or graphic equalizer to try to match the response achieved in the flat-response test from the head-phone output jack.

Shack stores.

The book covers all the basics such as SET and RESET, strings, PEEK and POKE, and machine language graphics and sound, then gets into geometric shapes and function plots, statistics, graphs, games, kaleidoscopes, plotting art, etc. Animation is explained by using an eye-blinking and antenna-twitching beast called Critter. (If several of the graphics examples look slightly familiar to those of who have been reading this column for a while, it is because *Creative* is one of the places the authors looked for ideas, and then improved upon what they found.)

On the last page in the book, the authors (whose address is Box 1868, La Mesa, CA 92041) offer a cassette or disk containing 35 of the major programs, for \$14.95. This is highly recommended if you hate to key in programs.

The 35 recorded programs are meant to be used in conjunction with the book, mainly to save you time in typing and correcting program errors as you go through the text, and thus "speed up your learning." The authors want you to run a program, think about what you see, read the line-by-line analysis, then go over the program to make sure you understand what makes it work.

Most of the programs display graphics that don't do anything other than show a graph, plot, sample menu, dragon, or lion's head, which is all the text calls for. But several do something other than just show a static display. One is Sketch; you use the arrow keys to draw whatever you like, in white on black or vice-versa, with counters keeping track of where the cursor is. Inkblot automatically draws a randomly-generated four-way kaleidoscopic pattern, by using the arrow keys (see the Short Program at the end of this column).

Spirals

Another active program is Spirals, from the section on circular graphics, using polar coordinates to create one new spiral after another, by increasing the angle of rotation for each new display.

You enter D, the "angle between points in degrees" (line 10) and indicate whether the spiral is to be drawn as a continuous line or as points (line 20). The spiral is begun at the center of the display by the SET in line 40.

The equation for the spiral is in line 70; additives 64.5 and 24.5 keep the spiral centered in the display; the .43 factor compensates for the 3:7 aspect ratio of the rectangular graphics block (how?). When the spiral reaches the edge of the display area, line 80 stops the drawing, jumps the program to a time delay in line 210, and after several seconds the next spiral is drawn, with D augmented by 1, which increases the angle between the points and thus draws a different spiral, some of which look rather odd.

Note that if the spiral is drawn as points, line 90 skips over half the program. Can you figure out how lines 100-190 are used to draw the spiral as made up of line segments?

For ordinary spirals, try a value for D such as 3, using P or L. For something quite different, use angles such as 88 or 122 degrees, first with lines, then with points. Notice the big difference in the appearance of spiral displays when using lines or points, when the angle is between 60 and 90. Why is this? Note how the spiral smooths out, using lines, when the angle increases from 315 toward 340 degrees.

To remove the delay between finishing one spiral and starting the next, replace the delay in line 210 with REM (why not just delete the line?). To increase the

speed of generating spirals, so you can more quickly see the effect of using various angles and either lines or points, reduce the 200 in line 60 to 25 or even 20 (after writing 210 REM).

When the program reaches line 220, it increases the value of D by one and jumps to line 30 to draw the next spiral automatically. But if you want to change the variables, press the spacebar, and when the current spiral is finished, the program jumps to line 10.

Note the difference between the "spiral" drawn with lines when D is 90 and when D is 90+360, or 450. Why are these spirals different?

Tandyvision One

Radio Shack's new \$249.95 computer-based electronic video game, Tandyvision One, is a custom-labelled Mattel Intellivision. According to the press release, "it can run all Mattel Intellivision and Sears Super Video Arcade cartridges." The game comes with *Las Vegas Poker* and *Blackjack*; 15 Intellivision cartridges are available through Radio Shack stores and dealers, ranging from \$17.95 for *Checkers* to \$34.95 for *Sea Battle* or *Star Strike*. Additional Intellivision game cartridges are available through Radio Shack's special ordering service, the "Intellivision Cartridge Hotline."

The 16-bit, microprocessor in Tandyvision One controls sound effects, music, color and high-resolution animated graphics.

Intellivision has been available at Macy's in New York for \$229.95 less a \$50 rebate, for a "final cost" of \$179.95.

Color-Computer Hi Res

Arnold Kahn writes from Chevy Chase, MD:

"I have followed your column with particular interest in matters relating to the TRS-80 Color Computer. I noted your comments on high resolution on the 4K machine, in the March 1982 issue." (Page 202 includes a program that accesses the hi-res mode without Extended Basic, and asks if anybody had figured out how to access the mode fully in the same way.)

"A careful reading of the Radio Shack introductory manual shows that a full screen at highest resolution requires 6K of RAM for the display alone. Since the 4K machine doesn't have it, there is no way to put up a full screen of high-resolution material. Also, because of the VDG-SAM (video display generator-synchronous address multiplexer) architecture, it is not possible to divide the screen into a graphic part and an alphanumeric part, the way some machines allow.

"The best route for the 4K owner is to upgrade the machine to 16K with his own two hands. It is easy. The cost these days is about \$16 for eight 4116 200-nsec memory chips to replace his eight 4027 chips. He'll need to see the Radio Shack Technical Manual for the Color Computer (which he should have anyway) or compare with a 16K machine. In addition to replacing the socketed chips, the owner must move two jumper plugs that are clearly marked. No soldering is required. The machine will then have 16K memory, and will be the best bargain-priced computer in the world. (It will not have Extended Basic, and the warranty will be dead.)

"Upgrading to 32K by piggybacking chips is possible, but it takes soldering. A 32K upgrade without soldering is in the form of a plugboard from Computerware.

"Extended Basic comes in a plug-in ROM, but costs about \$100, if you can get it. It is worth having for the editing capability alone, but then the cost is almost up to that of buying the machine fully equipped." They have a catalog of products for the Color Computer.

Short Program #37: Four-Way Doodle

Going back to the TRS-80 Graphics book, let's look at the doodle program in Listing 2.

You use the four arrow keys to move a blinking cursor left or right, up or down, and as you do so, the pattern you create is duplicated, in mirror fashion, in the other three quadrants, so the total effect is that of a four-way kaleidoscope. The pattern begins in the four corners, as initiated by line 20. Because the cursor can move anywhere on the screen, it may cross over into another quadrant. But you have only to look for the blinking cursor to locate what might be called the "master quadrant," the quadrant to concentrate on.

Press two arrow keys (such as the up and right arrows) simultaneously, and the pattern line will be drawn at an angle. When you're through drawing, press ENTER, and the cursor will stop flashing.

Line 30 tests location 14400 to see if it contains a value other than zero. The Radio Shack manuals are rather vague on what values will be stored in location 14400 when the arrow keys are pressed. You can find out easily enough by using this short program:

```
10 PRINT PEEK (14400):
20 GOTO 10
```

and while it is running, press any of the four arrow keys. You will soon see that the arrows put these values in location 14400: up, 8; down, 16; left, 32; right, 64.

Lines 40 and 50 "show a compact way

"...charming, attractive, witty; she's even kind to plants and animals. But if a gal can't hang ten on the computer wave, I say it's time to review the relationship."

to determine which of the arrow keys have been pressed," the book says. "The sign function is used in line 50 to determine an increment of -1, 0, or +1 for X and Y. P AND 96 is stored in I in line 40. The AND is used to mask out everything except 32 and 64 which represent the left and right arrows, respectively. If I is zero, neither the left nor the right arrow key was pressed, so H becomes zero. If I is 64, H will be +1, and if I is 32, H will be -1. K is calculated similarly. P AND 24 is stored in J. The AND tests for 8 and 16, which are returned by the up and down arrows. Then K is determined by -1, 0 or +1."

If that is not clear, it is partly because some is developed previous to that point in the book, and partly because the authors seem to take it for granted you will understand the Boolean algebra in line 40. Yet the Radio Shack manuals are very skimpy on Boolean: the Model III Basic manual provides one chart that is almost meaningless in its brevity; the Level II manual has almost the same chart, plus ten examples that are more mystifying than helpful because they are not explained thoroughly enough.

If the left arrow has been pressed, P will be 32. If we AND this value of P together with 96, we get

$$\begin{array}{r} 96 = 1100000 \\ 32 = 100000 \\ \hline 100000 = 32 \end{array}$$

If the right arrow has been pressed, then P will be 64, and if we AND this together with the same 96, we get

$$\begin{array}{r} 96 = 1100000 \\ 64 = 1000000 \\ \hline 1000000 = 64 \end{array}$$

Both examples show that if you AND a 1 with a 1, you get a 1, but if you AND a 1 or a 0 with a 0, you get a 0. Because 96 is the sum of 32 and 64, a single AND expression using 96 can test for both values to determine if the left or right arrow has been pressed.

If either has, then I is 32 or 64 (line 40) and H is -1 or +1 (line 50). If no arrow key has been pressed, then P is zero, I is zero, and H is zero.

The same logic operates for the up and down arrows, in the second halves of lines 40 and 50, to decide whether K will be -1, 0, or +1.

If adding the values of H or K to the X-Y position of the cursor means the cursor will touch the boundaries of the graphics area (X between 0 and 127, Y between 0 and 47, inclusive), line 60 or 70 causes the program to jump back to

line 30 to wait for you to press an arrow key that moves the cursor away from (or along) the boundary. Otherwise the values of H and K will be added to the X-Y position of the cursor, and lines 80-100 will add pixels in each quadrant in accord with which arrow keys are pressed.

When you are "done with your creation, press ENTER. The cursor will stop flashing so that you can admire your work. Then, any key will clear the screen and start the program again," the book says.

When you press ENTER, P becomes a 1, as you will find if you run the two-line program and press ENTER. Line 105 will then cause the program to jump to line 130, skipping over the RESET in line 110 that causes the cursor to blink, thus stopping the blinking and putting a hold on everything until you press any key, which causes a jump to line 10, to clear the screen and restart the program.

If all that was easy, then you might try answering these questions: 1) What is the value of P when two arrow keys are pressed simultaneously? 2) What happens when you press both the left and right arrow keys simultaneously? 3) Does one of those two keys have precedence, and why? 4) What does the DEFINIT in line 10 do for the program? □

Steve Gray

Minds and Mechanisms: Philosophical Psychology and Computational Models, by Margaret A. Boden. Cornell University Press, Ithaca, NY. 317 pages, hardcover \$29.50. 1982.

This collection of essays is by a professor of philosophy and psychology at the University of Sussex (England) who also wrote *Artificial Intelligence and Natural Man*. In this latest book, she "presents an interdisciplinary study of our mental representations of the world and their transformations that mediate our thinking, action and experience," according to the dust jacket.

Boden "addresses four closely related questions: What is the nature of the mind, and of specific mental phenomena, such as intention, reasoning, choice, or repression? What sorts of concepts are required for an adequate theoretical psychology? How is it possible for the mind to be embodied? And what is the relation between psychology, on one hand, and physiology or biology on the other? Boden adopts a computational approach to these questions, claiming that the concepts and insights of computer science and artificial intelligence are useful in describing and explaining psychological processes."

The book "will interest both philosophers and cognitive scientists," the dust jacket continues, after noting that Boden "shows that the computational metaphor stresses features of the human mind—such as purpose and subjectivity—which many psychological theories have ignored or even denied."

The 13 essays are divided into four parts: Explanation and Computation (The Computational Metaphor in Psychology, The Case for a Cognitive Biology, etc.), What We Have in Mind (The Structure of Intentions, Real-World Reasoning, Implications of Language Studies for Human Nature), Psychologists Ancient and Modern, and Values and Psychological Theory (Human Values in a Mechanistic Universe, Optimism).

For most readers of *Creative*, this book will seem more or less like a collection of intellectual trivia. For the remaining few who enjoy (and understand) sentences such as, "This morphological-behavioral continuity presumably involves biological clocks as organizing principles, since these are basic to the spatio-temporal organization of embryogenesis," there are many more such phrases. There are some interesting passages, but they are few and far between in what seems to be essays written by one PhD for other PhDs.

TRS-80 Color Programs, by Tom Rugg and Phil Feldman. Dilithium Press, 11000 S.W. 11 St., Beaverton, OR 97005. 348 pages, paperback \$19.95. 1982.

Although the price for this paperback seems high, it contains 37 programs, which works out to about 54 cents each; rather cheap, even if you do have to enter them via the keyboard.

The title is somewhat misleading, because very few of the 37 programs require color. The subtitle, which is printed only on the inside pages, is more helpful: "Programs for Color Basic and Extended Color Basic on the TRS-80 Color Computer."

March 1983 • Creative Computing

views...book

The 37 programs are divided into six sections: Applications (Biorhythm, Checkbook, Mileage, Sortlist, etc.); Educational (math drill, metric tutorial, vocabulary drill, etc.); Games (Roadrace, Wari, Obstacle, etc.); Graphics Display (kaleidoscope, sparkling patterns, overlaying concentric squares, etc.); Mathematics (least-squares curve-fitting, simple graphs, integration, simultaneous linear equations, etc.); and Miscellaneous (approximating pi, powers, Pythagorean triplets, play music, etc.).

Three of the graphics programs require color for their effects, and color does enhance most of the games as well as many of the other programs. One very nice feature is a center section with 15 full-color displays of a dozen of the programs. This adds to the cost of the book, but does give you a chance to see exactly what the displays look like; this is one of the very few Color Computer books that show some displays in color.

Not everybody will be delighted by the mix of programs, many of which the average Color Computer user would seldom if ever use. However, a great deal can be learned from this book, because each program is fully documented, with sections on Purpose, How to Use It, Sample Run, Program Listing, Easy Changes, Main Routines (groupings of program lines), Main Variables, and Suggested Projects (more extensive modifications and extensions).

The writing is a little stiff and sometimes wordy, but it does explain the program in fine detail. This is the book to get if you've been having trouble finding programs for your Color Computer. And even if you use only half a dozen of the 37, that's still only \$2 each.

By now cassettes of the programs should be available: one cassette for each of the six sections of the book, at about \$12.95 each.

Introduction to 8080/8085 Assembly Language Programming, by Judi S. Fernandez and Ruth Ashley. John Wiley & Sons, New York. 314 pages, paperback \$8.95. 1981.

Written by the team that also authored two other Self-Teaching Guides for Wiley, "Job Control Language" and "Using CP/M," this is another assembly-language book that is best understood if you already have some knowledge of the subject.

By page 12, the authors have introduced registers and flags, without having provided enough background for the beginner to know what they're for. As with other books in the STG series, this one is also divided into frames, which are "short sections in which information is presented or reviewed, followed by questions which ask you to apply the information," according to an early page. So you get a lot of drill, but unless you already have some background in assembler you'll be learning by rote until it all begins to hang together (if indeed it all does). Perhaps then you can shuffle the various sections around in your mind, and mentally backtrack to reconsider the material you originally took on faith, but not many people can perform such mental feats. It is easier to read the book twice.

The first chapter, an introduction, gives some general material on assembler, goes briefly into bits and bytes, and then on page 8 presents registers, for the first time, without any previous text leading up to A, B, C, D and the other

ews...book

registers. This is no problem if you know something about registers, but if you don't, you'll probably be rather confused, because there are no drawings or charts to help explain what registers are.

Chapter two is on Number Systems and Data Representation, and is written very clearly and simply with plenty of drill work. Then you get hit with chapter three, on Instruction Format, which is bound to mystify the beginner all over again, with a lot of "what" but almost no "why."

Most of the material required to make a good book for those with some knowledge of assembler is here, but not in the right order. The authors seem to have little sense of how to move gradually from the simple concepts to the more complex ones, and instead mix them together. This is one of the very few Wiley books that miss the mark.

DON'T (Or How to Care For Your Computer), by Rodney Zaks. Sybex, 2344 Sixth St., Berkeley, CA 94710. 232 pages, paperback \$11.95, 1981.

This may indeed be, as the press release claims, the first book that "explains how to handle and maintain all components of a computer system: the computer proper, the CRT display, the diskettes, the printer, the magnetic tapes."

Since such information, at the personal computer level, could hardly fill 232 pages, much of the book is taken up with describing what computers and peripherals are, and how they work. After a very general chapter on computer care, and another that gives a fast run-through on what a computer system is, we learn how to treat floppy disks with tender loving care, in 36 detailed pages that cover just about everything on the subject.

Then we learn what (and what not) to do with hard disks, the computer, CRT, printer, and tape units, with detailed information on preventing damage, cleaning, temperature and power problems, maintenance, etc. The last few chapters are more general, on the computer room (floor planning, electrical power, fire protection, etc.), software, documentation, security, and help (maintenance). An appendix lists tape and disk manufacturers.

Much of the information is of the common-sense type, but of course many of us are sometimes guilty of ignoring some of the simplest rules. Most computeriks can learn much from this book, especially those just getting into disk drives. The chapter on floppy disks alone may well be worth the \$11.95 to those who might easily cause expensive damage to their drives without even half-trying.

The writing is simple and direct, and the book provides much useful information in addition to the how-to-care-for details.

The Guide to DP Training Courses: Descriptions of Over 300 Programs and Workshops, edited by Jocelyn W. Franklin. Human Resource Development Press, 22 Amherst Road, Amherst, MA 01002. 364 pages, looseleaf in three-ring binder, \$95 including two future supplements, 1982.

According to the accompanying letter, this "unique reference book" will "enable DP managers and trainers to compare costs, content and objectives for hundreds of training programs."

More than 350 training courses, seminars and workshops are divided into nine major areas, such as applications, programming, systems analysis, systems design, databases, management skills, and others. Each page-long description includes information on audience (such as "beginning programmers"), course objectives (such as "understand database calls, code IMS batch programs"), course topics, delivery system (length of course, number of participants, hours per day), cost, and contact.

Two indexes are provided, one by subject, the other by vendor. Also included is a list of additional vendors offering courses about which information wasn't received in time for this volume; many of them will be included in the two supplements.

The mix includes a great variety, such as database fundamentals, VASM for Cobol programmers, DP project management structured test plans, RDOS system programming, digital PABX, personal computers for business, active listening skills, and computer auditing, to pick one from each of the nine sections of the book.

This may be the only publication of its kind, and although it obviously can get out of date quickly, seems well worth the money if you are looking for information on DP training courses.

The Basic Conversions Handbook for Apple, TRS-80, and PET Users, by David A. Brain et al. Hayden Book Co., Rochelle Park, NJ, 86 pages, paperback \$7.95, 1981.

Written by a New Hampshire group of four called the Brain Bank, this is a guide to converting "a Basic program for TRS-80, Apple II, or PET into the form of Basic used by any other one of those machines.... Also described are variations in graphics capabilities, PEEK, POKE, and CALL statements, cursor and control characters, memory locations, etc.," the back cover says.

A three-page chapter on Methods of Translation is followed by the three main chapters, on converting into one of the three Basics. Each of the three chapters is divided into two parts on converting from one machine into the particular Basic. That means six separate sections, each four to 24 pages long.

The shortest section is on translating PET into Apple II, and mostly consists, like the rest of the sections, of a long list of PET commands with equivalent Apple II commands. Many are identical (all three machines use Microsoft Basic), some require changes, and a very few have no equivalent. A brief paragraph on graphics notes that "The PET has a built-in character ROM for various graphics characters....to compensate for this feature, you must create your own graphic version of the symbols provided on the PET." Charts at the end of the book give "screen coordinate conversion" from one computer to another (as well as information on subroutines and sample program conversions).

This book gives the simplest conversion information, and as such is simple and fast to use. More details are given in the \$10.95 Dilithium book by Larry Noonan, *Basic Basic-English Dictionary for the Apple, Pet, and TRS-80*. This book provides an alphabetic listing of commands, and shows how each is implemented in the three computers. However, you have to figure out how to make the conversions. Take your choice: fast conversion or more details. ☐

AT LAST! A FULL implementation of the program ELIZA written by Joseph Weizenbaum for the microcomputer.

Created by MIT in 1968, ELIZA has become the world's most celebrated natural language simulation program. ELIZA is a non-directive psychotherapist who analyzes each statement as you type it and then responds with her own comments and questions. And her remarks are often strikingly appropriate.

Designed to run on a single microcomputer, ELIZA has heretofore been unavailable to personal computer users except in greatly pruned versions. Now the sophistication which made the original program so fascinating

Now, our new microcomputer version possesses the FULL power and range of expression of the original in being offered at the introductory price of only \$95. And if you want to find out how new and great it has been, too, we will include the complete **ELIZA Program** for only \$30 additional.

Introducing the Most Powerful Business Software Ever!

TRS-80™ (Model I, II, III, or 16) • APPLE™ • IBM™ • OSBORNE™ • CP/M™ • XEROX™

The VERSABUSINESS™ Series

Each VERSABUSINESS module can be purchased and used independently, or can be linked in any combination to form a complete, coordinated business system.

VERSA RECEIVABLES™ \$99.95
VERSA RECEIVABLES™ is a complete menu driven accounts receivable, invoicing, and monthly statement generating system. It keeps track of all information related to who owes you or your company money, and can provide automatic billing for past due accounts. VERSA RECEIVABLES™ prints all necessary statements, invoices, and summary reports and can be linked with VERSALEDGER II™ and VERSA INVENTORY™.

VERSA PAYABLES™ \$99.95
VERSA PAYABLES™ is designed to keep track of current and aged payables, keeping you in touch with all information regarding how much money your company owes, and to whom. VERSA PAYABLES™ maintains a complete record on each vendor, prints checks, check registers, vouchers, transaction reports, aged payables reports, vendor reports, and more. With VERSA PAYABLES™, you can even let your computer automatically select which vouchers are to be paid.

VERSA PAYROLL™ \$99.95
VERSA PAYROLL™ is a powerful and sophisticated, but easy to use payroll system that keeps track of all government required payroll information. Complete employee records are maintained, and all necessary payroll calculations are performed automatically, with totals displayed on screen for operator approval. A payroll can be run totally, automatically, or the operator can intervene to prevent a check from being printed, or to alter information on it. If desired, totals may be posted to the VERSALEDGER II™ system.

VERSA INVENTORY™ \$99.95
VERSA INVENTORY™ is a complete inventory control system that gives you instant access to data on any item. VERSA INVENTORY™ keeps track of all information related to what items are in stock, out of stock, on backorder, etc., stores sales and pricing data, alerts you when an item falls below a preset reorder point, and allows you to enter and print invoices directly on to link with the VERSA RECEIVABLES™ system. VERSA INVENTORY™ prints all needed inventory listings, reports of items below reorder point, inventory value reports, period and year to date sales reports, price lists, inventory checklists, etc.

VERSA LEDGER II™ \$149.95
VERSA LEDGER II™ is a complete accounting system that grows as your business grows. VERSA LEDGER II™ can be used as a simple personal checkbook register, expanded to a small business bookkeeping system or developed into a large corporate general ledger system without any additional software.

- VERSALEDGER II™ gives you almost unlimited storage capacity (500 to 10,000 entries per month, depending on the system),
- stores all check and general ledger information forever,
- prints tractor-feed checks,
- handles multiple checkbooks and general ledgers,
- prints 17 customized accounting reports including check registers, balance sheets, income statements, transaction reports, account listings, etc.

VERSA LEDGER II™ comes with a professionally written 160 page manual designed for first time users. The VERSALEDGER II™ manual will help you become quickly familiar with VERSALEDGER II™, using complete sample data files supplied on diskette and more than 50 pages of sample printouts.

SATISFACTION GUARANTEED!

Every VERSABUSINESS™ module is guaranteed to outperform all other competitive systems, and at a fraction of their cost. If you are not satisfied with any VERSABUSINESS™ module, you may return it within 30 days for a refund. Manuals for any VERSABUSINESS™ module may be purchased for \$20 each, credited toward a later purchase of that module.

REMEMBER:

MORE THAN JUST ANOTHER PRETTY FACE.

Says who? Says ANSI.

Specifically, subcommittee X3B8 of the American National Standards Institute (ANSI) says so. The fact is all Elephant™ floppies meet or exceed the specs required to meet or exceed all their standards.

But just who is "subcommittee X3B8" to issue such pronouncements?

They're a group of people representing a large, well-balanced cross section of disciplines—from academia, government agencies, and the computer industry. People from places like IBM, Hewlett-Packard, 3M, Lawrence Livermore Labs, The U.S. Department of Defense, Honeywell and The Association of Computer Programmers and Analysts. In short, it's a bunch of high-caliber nitpickers whose mission, it seems, in order to make better disks for consumers, is also to

make life miserable for everyone in the disk-making business.

How? By gathering together periodically (often, one suspects, under the full moon) to concoct more and more rules to increase the quality of flexible disks. Their most recent rule book runs over 20 single-spaced pages—listing, and insisting upon—hundreds upon hundreds of standards a disk must meet in order to be blessed by ANSI. (And thereby be taken seriously by people who take disks seriously.)

In fact, if you'd like a copy of this formidable document, for free, just let us know and we'll send you one. Because once you know what it takes to make an Elephant for ANSI...

We think you'll want us to make some Elephants for you.
